BEFORE THE

KANSAS CORPORATION COMMISSION

PREPARED DIRECT TESTIMONY OF

GARY L. GRONINGER

ON BEHALF OF

MIDWEST ENERGY, INC.

1	DIRECT TESTIMONY OF GARY L. GRONINGER
2	Q: Please state your name and business address.
3	A: Gary L. Groninger 10400 Holmes Road, Kansas City, Missouri 64114
4	Q: What is your occupation?
5	A: I am a Project Manager with Burns & McDonnell in the company's Business and
6	Technology Services Division.
7	Q: How long have you been associated with Burns & McDonnell?
8	A: I have been with the firm continuously since January 2003. Prior to that, I have been
9	employed by the following companies: Black & Veatch, Siemens Westinghouse,
10	Sithe Energy, and Management Analysis Company.
11	Q: What is your educational background?
12	A: I have a Bachelor of Science Degree (Magna Cum Laude) in Mechanical Engineering
13	from Vanderbilt University and a Masters of Science Degree in Mechanical
14	Engineering from Purdue University.
15	Q: What is your professional experience?
16	A: I have over 30 years experience in many different areas related to the power and
17	utility industries. During that time I have provided executive-level management and
18	planning related services to electric utility clients, natural gas utility clients,
19	regulatory bodies, and governmental agencies. Types of services have included the
20	following: integrated resource plan development, asset valuations, operating plant
21	technical and operational evaluations, reports to bond rating agencies, and
22	development of corporate strategic and operational plans.
23	

Gary L. Groninger Direct Testimony Page 2

.

1 Q: Please describe your firm - Burns & McDonnell.

2	A: Burns & McDonnell is a full-service engineering, architecture, construction,
3	environmental and consulting solutions firm. Our multi-disciplined staff of more than
4	2,500 employee-owners includes engineers, architects, construction experts, planners,
5	estimators, economists, technicians and scientists, representing virtually all design
6	disciplines. We plan, design, permit, construct and manage facilities all over the
7	world. Burns & McDonnell first started business in 1898 and has an emphasis on
8	customer satisfaction.
9	Q: For whom are you testifying in this proceeding?
10	A: I am testifying on behalf of the Midwest Energy, Inc. (Midwest Energy). Midwest
11	Energy is an electric and natural gas utility serving parts of central and western
12	Kansas. Midwest Energy currently serves approximately 48,000 retail electric
13	customers, with wholesale sales to ten municipal utility systems throughout Kansas.
14	Midwest Energy is headquartered in Hays, Kansas and currently has operating power
15	plants in Bird City, Colby, and Great Bend.
16	Q: Why was there a need for Midwest Energy to issue a Request for Proposals
17	(RFP)?
18	A: Generating plants that Midwest Energy owns and operates can only supply a small
19	fraction of its customers' total needs. Midwest Energy must make up that shortfall by
20	purchasing capacity and energy from other sources, including other nearby utilities
21	and power generators. Many of Midwest Energy's current capacity and energy
22	contracts, commonly known as Power Purchase Agreements (PPAs), are set to expire
23	in the next few years. Rather than just renew these contracts at new, higher rates,

Gary L. Groninger Direct Testimony Page 3

.

1	Midwest Energy was interested in exploring the market to see if better terms or lower
2	cost options might be available. Furthermore, many of the existing contracts were not
3	eligible for renewal under their existing terms. As a result, Midwest Energy had a
4	need for base load, intermediate, and peaking capacity and energy. In order to
5	expand the "playing field" of potential suppliers, Midwest Energy was willing to
6	consider proposals for contracted capacity and energy from new resources, existing
7	resources, system power on an all or partial requirements basis, or as an owner of a
8	new or existing generating unit(s).
9	Q: Could you describe the RFP process in general?
10	A: The RFP process is a formal, structured method of obtaining competitive, market-
11	priced products in a bid environment open to all qualified suppliers.
12	Q: Could you describe the RFP specifically as it related to Midwest?
13	A: In March 2006 Midwest Energy issued a RFP for generation capacity and energy. In
14	order to increase the attractiveness of this RFP to potential suppliers, Midwest Energy
15	included the following features: 1) offer flexibility - a number of different contract
16	sizes and terms; 2) transmission flexibility – Midwest Energy asked that the supplier
17	provide only the point of receipt for the energy. Midwest Energy would take on the
18	burden of analysis of transmission requirements needed to deliver the power to
19	Midwest Energy's customers; and 3) site availability - for the project developer who
20	was interested in pursuing a new project within the Midwest Energy service territory,
21	Midwest Energy was willing to negotiate arrangements for a number of excellent

.

1	plant sites for the installation of generating units. In addition, Midwest Energy gave
2	potential suppliers over seven (7) weeks to respond with formal proposals.
3	Q: How was the RFP issued / advertised?
4	A: Electronic copies of the RFP were sent via e-mail to over two hundred (200)
5	representatives of utilities, developers, and power marketers. Written ads were
6	entered in many regional newspapers as well as national publications such as Energy
7	Daily. A pre-bid informational meeting was held at a Kansas City airport hotel on
8	March 29, 2006, about one month prior to the due date for the submission of bids -
9	April 27, 2006. Fifteen (15) people attended the pre-bid meeting representing eleven
10	(11) different companies.
11	Q: What was the response to the RFP?
12	A: As a result of the RFP, Midwest Energy received fourteen (14) offers from nine (9)
13	different companies. These offers were divided and eventually analyzed in two
14	separate groups: 1) base load proposals and 2) peaking proposals. Negotiation with
15	other bidders that proposed base load alternatives are on going. This testimony,
16	concentrating on the justification of the Goodman Energy Center, a peaking facility,
17	addresses only the peaking portion of the evaluation.
18	Q: Were the responses all for supply-side products, or were there products related
19	to demand-side management as well?
20	A: Two companies, ** *********************************
21	The ** proposal was based on dispatchable distributed generation (DDG) units
22	and load management. The DDG units being proposed by **

Gary L. Groninger Direct Testimony Page 5

.

1	considered to be available from the existing retail base of Midwest Energy. The
2	proposal anticipated that ** would contract for the control of these DDG
3	units up to a target of 50MW which could then be used by Midwest Energy for load
4	management purposes. If an average of 500kW per unit is considered, this would
5	require that 100 retail customers accept the ** state offer, assuming the 50MW
6	is all from DDG units. The likelihood of this many customers having this size of
7	DDG installations was considered unlikely by Midwest Energy. In addition, the
8	DDG installations proposed by **
9	could propose to existing clientele themselves without paying a fee to ******* **.
10	For these reasons, the ******** ****************************
11	The ** The ** proposal provided a demand reduction program that is managed by
12	** ***********************************
13	capabilities to reduce the peak demand by 8 MW with this control in effect for only
14	80 hours per year. The cost of this proposal, along with the knowledge that again
15	Midwest Energy could incorporate and implement this program themselves, also
16	caused this proposal to be eliminated from further consideration.
1 7	Q: How were the offers for peaking capacity analyzed?
18	A: Burns & McDonnell used a proprietary Screening Model it has used on numerous,
19	similar evaluations. Two equipment-only proposals were eliminated during the first
20	cut of economic analysis. The remaining proposals can be summarized as follows:
21	Wartsila - This was a proposal to sell Midwest Energy the generation equipment
22	required to construct a peaking plant consisting of internal combustion driven

generators. A multiple number of these units (8.4 MW each) could be utilized to
 provide capacity at any one location or possibly multiple locations.

** This proposal offered to construct, own and operate a combustion turbine peaking plant consisting of two 44 MW turbines (88 MW total) at a site on the Midwest Energy system, and sell Midwest Energy the capacity and energy. Midwest Energy would not operate the plant, but rather purchase energy under a PPA. This also meant that Midwest Energy did not need to commit capital resources to the project up front.

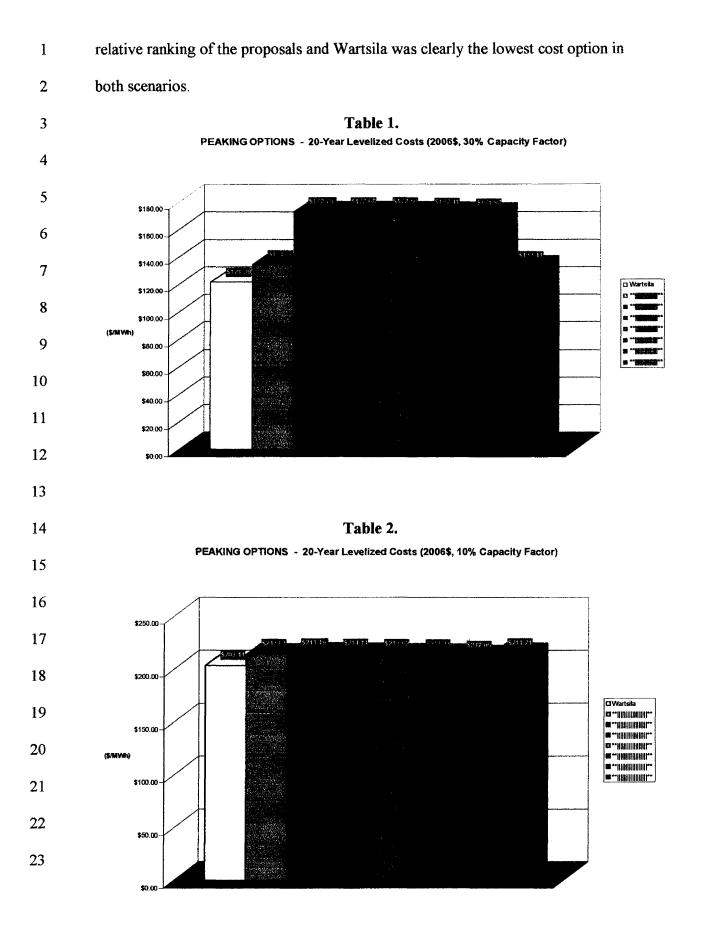

11

**.

12 ** More than the state of the second s

16 Q: How were the offers for peaking capacity analyzed?

A: Burns & McDonnell used its Screening Model. The basis for comparison of all
proposals was an all-in 20-year levelized cost, expressed in 2006 dollars. Capacity
factors of 10% and 30% were utilized in order to simulate the possible range of time
(876 hours to 2628 hours) that this peaking facility was expected to operate. As
shown in Tables 1 and 2 below, variation of the capacity factor does not change the

1 Q: What were the conclusions from the economic analysis?

2 A: Clear conclusions were drawn from this economic analysis:

At the relevant range of capacity factors, the Wartsila proposal was clearly evaluated
 to be the lowest cost. This analysis includes an estimate of the cost of constructing
 the balance of plant (i.e. the rest of the power plant beyond the generators and prime
 movers).

7 2) The cost advantage of the Wartsila proposal is particularly pronounced in the 30% load factor case, a relatively high load factor for a peaking plant. That lends 8 9 additional support to the project. Though Midwest Energy wouldn't normally plan 10 to operate a peaking facility 30% of the time, these units have an unusually good 11 heat rate. That means there may well be times when it is economical to generate 12 with this resource either to meet internal load requirements or for resale to other 13 parties. Accordingly it may actually operate at a capacity factor that is somewhat 14 higher than would normally be expected for a peaking resource.

Q: In addition to being the least cost, were there other benefits in the Wartsila
 proposal?

17 A: Other significant advantages to the Wartsila proposal are as follows:

Because it is comprised of multiple units each rated 8.4MW, Midwest Energy can
 commit only that amount of generation required at any point in time, and not have to
 operate the units at production levels that are less than optimal. That allows Midwest
 Energy to operate in a similar matter as it does today with its adjustable-schedule
 contracts, which are becoming "a thing of the past."

Gary L. Groninger Direct Testimony Page 9

1 2) The Wartsila plant would be constructed on land already owned by Midwest Energy northeast of Hays, adjacent to their Knoll Substation. This is where the generation 2 would be interconnected to the electric grid. Midwest Energy is currently targeting a 3 4 commercial operation date of June 1, 2008, though this is a very aggressive schedule. This schedule required execution of a purchase order no later than November 2006. 5 6 3) Additional advantages of this project relate directly to system reliability: In the event 7 of transmission disruptions or outages, these units are capable of being started and 8 loaded quickly, providing both voltage support and real/reactive power support in the 9 event of the loss of a significant element in the transmission network such as a line or 10 transformer. Furthermore, in the event of the loss of multiple transmission elements, 11 the Hays area could be supplied directly by these generating units. 12 **O:** What were the next steps? 13 A: Once the best resource options from the RFP were identified via the screening analysis 14 described above, Burns & McDonnell supported Midwest Energy with analysis of 15 their total power generation portfolio to determine the optimum mix of the each 16 power-generation resource. This was accomplished using PROMOD, an industry-17 wide standard production cost software model. After analyzing a number of different 18 resource mix scenarios, it was determined that a nine (9) engine Wartsila plant was most suitable for Midwest Energy's needs. A nine engine plant provides 75.6 MW 19 20 peaking capacity.

21 Q: What happened next?

Gary L. Groninger Direct Testimony Page 10

A: The addition of a Wartsila engine peaking plant was approved by Midwest Energy's
Board of Directors (BOD) on October 16, 2006. This action was preceded by a
number of RFP and project evaluation presentations as part of earlier BOD meetings
in the summer of 2006. Midwest Energy completed negotiations for an equipment
supply contract with Wartsila in December, 2006 and an Equipment, Procurement,
Construction (EPC) contract with Burns & McDonnell in February, 2007. Other
milestones to date are as follows:

Plant Named Goodman Energy Center	January, 2007
Air Permit Received	March, 2007
Construction Work Begins	April, 2007
Official Groundbreaking Ceremony at Site	May 10, 2007

8

۹. ۵

•

9 Q: When will the plant be placed in service?

10 A: The commercial operation date for the first six (6) engines (50 MW) is June 1, 2008.

11 The final three (3) engines (25 MW) are scheduled to be in operation on September 1,

12 Q: Does this conclude your testimony?

13 A: Yes
