Q. PLEASE STATE YOUR FULL NAME, ADDRESS, AND OCCUPATION.

A. My name is J. Randall Woolridge, and my business address is 120 Haymaker Circle, State College, PA 16801. I am a Professor of Finance and the Goldman, Sachs & Co. and Frank P. Smeal Endowed University Fellow in Business Administration at the University Park Campus of the Pennsylvania State University. I am also the Director of the Smeal College Trading Room and President of the Nittany Lion Fund, LLC. I provide a summary of my educational background, research, and related business experience in Exhibit JRW-2.

Q. ON WHOSE BEHALF ARE YOU TESTIFYING?

A. I have been asked by the Citizens' Utility Ratepayer Board ("CURB") to provide an opinion as to the overall fair rate of return or cost of capital for the Kansas jurisdictional electric utility operations of Evergy Kansas Central, Inc., Evergy Kansas South, Inc., and Evergy Metro, Inc., wholly-owned subsidiaries of Evergy, Inc. Evergy Kansas Central, Inc. and Evergy Kansas South, Inc., are referred to collectively herein as "EKC", and Evergy Metro, Inc.'s Kansas operations are referred to herein as "EKM". I will refer to EKM and EKC collectively as "the Companies."¹

Q. HOW IS YOUR TESTIMONY ORGANIZED?

A. The following outlines my testimony:

- First, I summarize my cost of capital recommendation for the Companies and review CURB's primary areas of contention on the Companies' position.
- Second, I provide an assessment of capital costs in today's capital markets.

¹ In my testimony, I use the terms "rate of return" and "cost of capital" interchangeably. This is because the required rate of return of investors on a utility company's capital is the cost of capital.

- 1 • Third, I discuss the selection of proxy groups for estimating the cost of equity capital for
2 the Companies.
- 3 • Fourth, I discuss the Companies’ recommended capital structure and debt cost rates.
- 4 • Fifth, I provide an overview of the concept of the cost of equity capital, and then estimate
5 the equity cost rate for the Companies.
- 6 • Finally, I critique the Companies’ rate of return analysis and testimony.

II. SUMMARY OF RECOMMENDATIONS

A. Overview

7 **Q. WHAT COMPRISES A PUBLIC UTILITY’S “RATE OF RETURN”?**

8 A. A public utility’s overall rate of return has three main components:

9 (1) capital structure (*i.e.*, ratios of short-term debt, long-term debt, preferred stock
10 and common equity);

11 (2) cost rates for short-term debt, long-term debt, and preferred stock; and

12 (3) common equity cost, otherwise known as return on equity (“ROE”).

13 **Q. WHAT IS A PUBLIC UTILITY’S ROE INTENDED TO REFLECT?**

14 A. ROE is described most simply as the allowed rate of profit for a regulated company. In a
15 competitive market, a variety of factors determine a company’s profit level, including the
16 state of the economy, the degree of competition a company faces, the ease of entry into its
17 markets, the existence of substitute or complementary products/services, the company’s

1 cost structure, the impact of technological changes, and the supply and demand for its
2 services and/or products. For a regulated monopoly, the regulator determines the level of
3 profit available to the public utility. The United States Supreme Court established the
4 guiding principles for determining an appropriate level of profitability for regulated public
5 utilities in two cases: (1) *Hope* and (2) *Bluefield*.² In those cases, the Court recognized that
6 the fair rate of return on equity should be:

7 (1) comparable to returns investors expect to earn on other investments of similar
8 risk;

9 (2) sufficient to assure confidence in the Companies' financial integrity; and

10 (3) adequate to maintain and support the Companies' credit and to attract capital.

11 Accordingly, finding the appropriate ROE for a regulated utility requires
12 determining the market-based cost of capital. The market-based cost of capital for a
13 regulated firm represents the return investors could expect from other investments, while
14 assuming no more and no less risk. The purpose of the economic models and formulas in
15 cost of capital testimony, such as my testimony's Discounted Cash Flow ("DCF") Model
16 and the Capital Asset Pricing Model ("CAPM"), is to use market data of firms with similar
17 risk to estimate the rate of return on equity investors require for this specific risk-class of
18 firms (*i.e.*, regulated utilities), in order to set an appropriate ROE for a regulated firm.

² *Fed. Power Comm'n v. Hope Natural Gas Co.*, 320 U.S. 591 (1944) (hereinafter "*Hope*"); *Bluefield Water Works and Improvement Co. v. Pub. Serv. Comm'n of W. Va.*, 262 U.S. 679 (1923) (hereinafter "*Bluefield*").

B. Summary of Positions

1 **Q. PLEASE REVIEW YOUR PROPOSED RECOMMENDATIONS REGARDING**
2 **THE APPROPRIATE RATE OF RETURN FOR THE COMPANIES.**

3 A. I provide the Companies' proposed capital structure and debt and equity cost rates in Table
4 1. The Companies' witness, Mr. Andrews, has proposed capital structures consisting of
5 48.00% long-term debt and 52.00% equity for EKM and 47.96% long-term debt and
6 52.04% equity for EKC.³ Mr. Andrews has proposed long-term debt cost rates of 4.37%
7 for EKM and 4.35% for EKC. Ms. Ann Bulkley proposes a ROE of 10.25% for the
8 Companies. Based on these components, Mr. Andrews has proposed an overall rate of
9 return or cost of capital of 7.43% for EKM and 7.42% for EKC.

10 **Table 1**
11 **Companies' Rate of Return Recommendations**

12 **EKM's Rate of Return Recommendation**

Capital Source	Capitalization Ratio	Cost Rate	Weighted Cost Rate
Long-Term Debt	48.00%	4.37%	2.10%
Common Equity	52.00%	10.25%	5.33%
Total	100.00%		7.43%

13 **EKC's Rate of Return Recommendation**

Capital Source	Capitalization Ratio	Cost Rate	Weighted Cost Rate
Long-Term Debt	47.96%	4.35%	2.09%
Common Equity	52.04%	10.25%	5.33%
Total	100.00%		7.42%

14

³ These are the capital structure ratios and debt cost rates as initially filed. The Companies have provided 2023 quarterly updates in response to CURB-8. Since these responses are confidential, I am providing the originally filed capital structure ratios and debt cost rates.

1 I provide my proposed cost of capital for the Companies in Table 2. The
2 Companies' proposed capital structures include much higher common equity ratios than
3 the averages of the two proxy groups. Furthermore, as discussed below, the S&P and
4 Moody's credit ratings of A- and Baa1 for EKC and A and Baa1 for EKM are superior to
5 the averages of the proxy groups. The Companies received these credit ratings after the
6 merger agreement was finalized and the Companies received their own separate
7 capitalizations. In the Companies' last two rate cases in 2018, which were settlements,
8 EKM and EKC agreed to capital structures with common equity ratios of 49.09% and
9 51.24%, respectively.⁴ They have operated with these capitalizations since that time and
10 have maintained their credit ratings. Hence, I am employing the capital structures adopted
11 in the Companies' last rate cases. I have adopted the Companies' proposed long-term debt
12 cost rates. I have applied the DCF Model and the CAPM to a proxy group of publicly-held
13 electric utility companies ("Electric Proxy Group") and the group developed by Ms.
14 Bulkley ("Bulkley Proxy Group"). My analysis indicates a common equity cost rate in the
15 range of 9.15% to 9.45%. Since I rely primarily on the DCF model and the results for the
16 Electric Proxy Group, and in light of the lower investment risk level of the Companies
17 relative to the proxy groups, I am using a ROE of 9.25% for the Companies. Given my
18 proposed capital structure and capital cost rates for the Companies, I am recommending an
19 overall fair rate of return or cost of capital of 6.77% for EKM and 6.86% for EKC. These
20 are summarized in Table 2 and Exhibit JRW-1.

⁴ The Docket Nos. are 18-KCPE-480-RTS and 18-WSEE-328-RTS.

1 **Table 2**
CURB's Rate of Return Recommendations

EKM's Rate of Return Recommendation

Capital Source	Capitalization Ratio	Cost Rate	Weighted Cost Rate
Long-Term Debt	50.91%	4.37%	2.23%
Common Equity	49.09%	9.25%	4.54%
Total	100.00%		6.77%

2 **EKC's Rate of Return Recommendation**

Capital Source	Capitalization Ratio	Cost Rate	Weighted Cost Rate
Long-Term Debt	48.76%	4.35%	2.12%
Common Equity	51.24%	9.25%	4.74%
Total	100.00%		6.86%

C. Primary Rate of Return Issues in this Case

3 **Q. PLEASE DESCRIBE THE PRIMARY RATE OF RETURN ISSUES IN THIS**
4 **CASE.**

5 **A.** The primary rate of return issues in this case are the appropriate capital structure and ROE
6 for the Companies.

7 **1. The Companies' Assessment of Capital Market Conditions:** Ms. Bulkley's
8 analyses, ROE results, and recommendations are based on assumptions of higher
9 interest rates and capital costs. However, despite the increase in inflation and
10 interest rates over the past year, there are several factors suggesting the equity cost
11 rate for utilities has not risen significantly. To support this contention, I show that:
12 (1) despite the increase in year-over-year inflation, long-term inflation expectations
13 are still about 2.50%; (2) the yield curve is currently inverted – which suggests that

1 investors expect yields to decline and that a recession in the next year is very likely,
2 which would also put downward pressure on interest rates; (3) interest rates have
3 fallen since their peak in October 2022; and (4) while authorized ROEs for utilities
4 hit all-time lows in 2020 and 2021, these ROEs did not decline nearly as much as
5 interest rates and in 2022, with the 30-year Treasury yield up 105 basis points,
6 authorized ROEs for electric utilities only increased 16 basis points.

7 **2. The Companies' Investment Risk is Below the Average of the Two Proxy**

8 **Groups:** The S&P and Moody's credit ratings of A- and Baa1 for EKC and A and
9 Baa1 for EKM are superior to the averages of the proxy groups. These issuer credit
10 ratings indicate that the Companies' investment risk is below the average of the two
11 proxy groups, who have average S&P and Moody's issuer credit ratings of BBB+
12 and Baa2.

13 **3. The Companies' Proposed Capital Structure Includes an Inflated Common**
14 **Equity Ratio and Lower Financial Risk than the Two Proxy Groups:** The

15 Companies' proposed capital structures include much higher common equity ratios
16 than the averages of the two proxy groups. Furthermore, as discussed below, the
17 S&P and Moody's credit ratings of EKC and EKM are superior to the averages of
18 the Proxy groups. In the Companies' last rate cases in 2018, which were both
19 settlements, EKM and EKC agreed to capital structures with common equity ratios
20 of 49.09% and 51.24%, respectively. EKC and EKM have operated with these
21 capitalizations since that time and have maintained their credit ratings. Hence, I am
22 adopting the capital structures agreed to in the Companies' last rate cases.

1 **4. DCF Equity Cost Rate:** Ms. Bulkley and I both employ the traditional constant-
2 growth DCF model. However, Ms. Bulkley overstates reported DCF results in two
3 ways: (1) by exclusively using the overly optimistic and upwardly biased earnings
4 per share (“EPS”) growth rate forecasts of Wall Street analysts and *Value Line*; and
5 (2) by claiming that the DCF results underestimate the market-determined cost of
6 equity capital due to high utility stock valuations and low dividend yields. By
7 contrast, to develop the DCF growth rate for my analysis, I reviewed 13 growth rate
8 measures, including historical and projected growth rate measures, and have
9 evaluated growth in dividends, book value, and EPS.

10 **5. CAPM Equity Cost Rate:** The CAPM approach requires an estimate of the risk-
11 free interest rate, the beta, and the market or equity risk premium. Two problems
12 arise from Ms. Bulkley’s CAPM analysis: (1) employing the Empirical CAPM
13 (“ECAPM”) version of the CAPM results in inappropriate adjustments to the risk-
14 free rate and the market risk premium; and (2) more significantly, computing a
15 market risk premium of 8.31%. This 8.31% market risk premium is larger than:
16 (1) historic stock and bond return data indicate; and (2) published studies and
17 surveys of the market risk premium find. In addition, I demonstrate that Ms.
18 Bulkley bases the 8.31% market risk premium on unrealistic assumptions of future
19 economic and earnings growth and stock returns. To compute that market risk
20 premium, Ms. Bulkley applied the DCF model to the S&P 500 and employed an
21 average projected EPS growth-rate of 10.26% to compute an expected market
22 return of 12.11% and market risk premium of 8.31%. First, I have conducted a study

1 that shows Ms. Bulkley's expected stock market return of 12.11% is almost double
2 the average annual stock return of 6.80% that investment firms tell investors to
3 expect over the next ten years. In addition, as I demonstrate later in my testimony,
4 the EPS growth-rate projection (10.26%) used for the S&P 500 and the resulting
5 expected market return (12.11%) and market risk premium (8.31%) both include
6 unrealistic assumptions regarding future economic and earnings growth and stock
7 returns.

8 As I highlight in my testimony, it is common to use three approaches in
9 estimating a market risk premium – historic returns, surveys, and expected return
10 models. I use a market risk premium of 5.50%, which: (1) factors in all three
11 approaches to estimate a market premium; and (2) employs the results of many
12 studies of the market risk premium. As I noted, the 5.50% figure reflects the market
13 risk premiums: (1) that have been determined by leading finance scholars in recent
14 academic studies; (2) that are employed by leading investment banks and
15 management consulting firms; and (3) that are contained in surveys of companies,
16 financial forecasters, financial analysts, and corporate CFOs.

17 **6. Alternative Risk Premium Model:** Ms. Bulkley also estimates an equity cost rate
18 using an alternative risk premium model, calling it the Bond Yield Risk Premium
19 approach. Ms. Bulkley computes this risk premium using a regression of the
20 historical relationship between the yields on long-term Treasury bonds and
21 authorized ROEs for electric utility companies. Ms. Bulkley computes the
22 estimated ROE as the projected risk-free rate plus the risk premium. I discuss

1 several issues with this approach in more depth later, but the primary problems with
2 this approach are: (1) this particular risk premium approach is a gauge of *regulator*
3 behavior rather than *investor* behavior; (2) this methodology produces an inflated
4 measure of the risk premium because this approach uses historical authorized ROEs
5 and Treasury yields, and the resulting risk premium is applied to projected Treasury
6 yields; (3) the risk premium in this approach is inflated as a measure of investors'
7 required risk premium, since electric utility companies have been selling at market-
8 to-book ratios in excess of 1.0; and (4) the ROE is dependent on the authorized
9 ROEs from state utility commissions, and the Werner and Jarvis study (2022),
10 which is discussed below, demonstrated that authorized ROEs over the past four
11 decades have not declined in line with capital costs and, therefore, past authorized
12 ROEs have overstated the actual cost of equity capital.

13 **7. Regulatory and Business Risks:** Ms. Bulkley also considers several elements of
14 the Companies' regulatory and business risks in arriving at her 10.25% ROE
15 recommendation. These include the Companies' capital expenditures and elements
16 of the Companies' regulatory risk in Kansas. However, these two factors are risk
17 considerations utilized in the credit rating process. As noted above, the Companies'
18 S&P and Moody's issuer credit ratings are above the average S&P and Moody's
19 issuer credit ratings for the proxy groups, which are BBB+ and Baa2. Hence,
20 despite these factors, the Companies' investment risk is still below the average of
21 the proxy groups.

III. CAPITAL MARKET CONDITIONS AND AUTHORIZED ROEs

A. Capital Market Conditions

1 **Q. PLEASE REVIEW TRENDS IN UTILITY CAPITAL COSTS INDICATORS.**

2
3 A. Page 1 of Exhibit JRW-2 shows the yields on A-rated public utility bonds. These yields
4 gradually declined in the past 15 years from 7.5% to the 3.0% range. These yields
5 bottomed out in the 3.0% range in 2020 and 2021 due to the economic fallout from the
6 Covid-19 pandemic. They increased with interest rates in general over the past year, peaked
7 at almost 6.0%, and now are in the 5.25% range.

8 Page 2 of Exhibit JRW-2 shows the average dividend yield for electric utilities.
9 These yields declined over the past 13 years, bottoming out at 3.1% in 2019. They increased
10 to 3.6% in 2020 but declined to 3.4% in 2022.

11 Page 3 of Exhibit JRW-2 shows the average earned ROE and market-to-book ratio
12 for publicly held electric utilities. The average earned ROE has been in the 9.0% to 10.2%
13 range over the past five years. The average market-to-book ratio increased over the last 13
14 years, peaked at 2.0X in 2019, and declined to the 1.75X range in 2020, 2021, and 2022.

15 **Q. PLEASE REVIEW INTEREST RATE MOVEMENTS IN RECENT YEARS.**

16 A. Figure 1 below shows 30-year Treasury yields over the past 13 years (2010 to 2022). These
17 yields were in the 3.0% range at the end of 2018. These yields declined to the 2.25% range
18 in 2019 due primarily to slow economic growth and low inflation. In 2020, with the advent
19 of the COVID-19 pandemic in February of that year, 30-year Treasury yields declined to
20 record low levels, declining about 100 basis points to the 1.25% range. They began their

1 recovery in the summer of 2020 and increased to about 2.50% in the first quarter of 2021.
2 They subsequently fell to below 2.0% in the fourth quarter of 2021, but increased
3 significantly in 2022, peaking at over 4.40% in October. They have been in the 3.50% to
4 4.40% in 2023 and currently, these rates are at the higher end of this range.

5 **Figure 1**
30-Year Treasury Yields

6 Data source: <https://fred.stlouisfed.org/series/DGS30>.

7 **Q. HAVE UTILITIES TAKEN ADVANTAGE OF THE LOWER BOND YIELDS TO**
8 **RAISE CAPITAL?**

9 **A.** Yes. Figure 2 shows the annual amounts of debt and equity capital raised by public utility
10 companies over the past 13 years. Electric utility and gas distribution companies have
11 taken advantage of the low interest rate and capital cost environment of recent years and
12 raised record amounts of capital in the markets. In fact, in four of the past five years, public

1 utilities have annually raised over \$100 billion in combined debt and equity capital. The
2 total dropped to \$92 billion in 2022.

3 **Figure 2**
Debt and Equity Capital Raised by Public Utilities
2010–2022

4 Data Source: S&P Global Market Intelligence, S&P Cap IQ, 2023.

5 **Q. PLEASE DISCUSS THE INCREASE IN INTEREST RATES SINCE THE**
6 **BEGINNING OF 2022.**

7 A. Several factors have led to higher interest rates in 2022, generally tied to an improving
8 economy and higher inflation. Real GDP growth increased 5.7% in 2021, compared to a
9 decline of -3.4% in 2020. This recovery led to greater business activity, higher levels of
10 business and consumer spending, and record increases in housing prices. Unemployment,
11 which was 6.7% in 2020, has declined to 3.5% in 2022. The recovery in the economy puts
12 upward pressure on interest rates by increasing the demand for capital.

13 In addition, as reported extensively in the financial press, inflation picked up
14 significantly in 2022, putting additional pressure on interest rates. Reported year-over-year
15 inflation has been as high as 9.10% in 2022. Year-over-year inflation had declined on a
16 monthly basis since October 2022, and is at 3.90% as of July 2023. The high inflation

1 reported in the past year primarily reflects three factors: (1) the recovering economy, as
2 discussed above; (2) the production shutdowns during the pandemic leading to supply
3 chain shortages as the global economy has recovered; and (3) the war in Ukraine, which
4 has led to higher energy and gasoline prices worldwide.

5 In response to the higher inflation, the Federal Reserve increased the discount rate
6 by 25 basis points in March 2022; 50 basis points in May 2022; and 75 basis points in June,
7 July, September, and November 2022; 50 basis points in December 2022; and 25 basis
8 points in February, March, May, and July 2023. However, the Federal Reserve's actions
9 on the discount rate directly affect only short-term rates. Long-term rates are more a
10 function of expected economic growth and expected inflation. One conundrum is that
11 whereas the U.S. government has been reporting annual year-over-year inflation rates as
12 high as 9.10% in the past year, the 30-year Treasury yield is still only about 4.25%.

13 **Figure 3**
Year-Over-Year Inflation Rates
2020-2023

14 Source: <https://www.statista.com/statistics/273418/unadjusted-monthly-inflation-rate-in-the-us/>

15 Investors' inflation expectations can be seen by looking at the difference between
16 yields on ordinary Treasuries and the yields on inflation-protected Treasuries, known as
17 TIPS. Figure 4 shows the expected inflation rate over the last five, ten, and thirty years.
18 One can see the big increase in 2022, but it has fallen off and is now at an expected inflation

1 rate of 2.26% over the next five years. The expected inflation rates over the next ten and
2 thirty years are 2.38% and 2.27%. The bottom line is: the expected long-term inflation
3 rate is around 2.25%.

4 **Figure 4**
5-Year, 10-Year, and 30-Year Breakeven Inflation Rates

5 Date source: <https://fred.stlouisfed.org/>.

6 **Q. DO YOU BELIEVE THAT INTEREST RATES WILL CONTINUE TO INCREASE**
7 **INTO 2023?**

8 A. No. As discussed above, the current inflationary environment has pushed up interest rates
9 over the past year. Also, as noted above, the Federal Reserve has responded with a series
10 of discount rate increases, with the intention of slowing the economy and cooling down
11 inflation, which would lower interest rates. Figure 5 shows the yield curve, which plots
12 the yield-to-maturity and time-to-maturity for Treasury securities. The yield curve is
13 usually upward sloping because investors require higher returns to commit capital for
14 longer periods of time. Currently, the yield curve is said to be “inverted,” which means
15 that the yields on shorter-term maturity securities are higher than the yields on longer-term
16 securities. This means that investors do not expect interest rates to remain where they are
17 and expect that they should decline.

1

Figure 5
The Yield Curve
The Yield-to-Maturity and Time-to-Maturity for Treasury Securities

Source: <https://www.ustreasuryyieldcurve.com/> - 8-24-23.

2 The financial press has focused on another aspect of an inverted yield curve. An
3 inverted yield curve also is an indicator of a pending recession, which would also put
4 downward pressure on interest rates. An inverted yield curve is usually indicated when the
5 2-year Treasury yield is above the 10-year Treasury yield. Figure 6 graphs two lines: (1)
6 the 10-year Treasury yield minus the 2-year Treasury yield (blue line); and (2) the 30-year
7 Treasury yield (red line). In Figure 6, the shaded areas are economic recessions, defined
8 as two-straight quarters with negative GDP growth. In Figure 6, one can see that every
9 time the yield curve inverted (2-year > 10-year) in the last 50 years, a recession followed.
10 In addition, one can see that interest rates, as indicated by the 30-year Treasury yield in
11 Figure 6, decline during recessions. Since the yield curve is currently inverted, a recession
12 and lower interest rates are likely to follow.

3

Q. PLEASE SUMMARIZE YOUR ASSESSMENT OF THE CURRENT CAPITAL MARKET SITUATION.

4

5

A. The U.S. economy, as measured by nominal GDP, declined nearly twenty percent in the first half of 2020, then rebounded significantly in 2021 and continued the rebound in 2022. This rebound has seen significant increases in consumer and business spending, lower unemployment, and higher housing prices. The rebounding economy has put pressure on prices. This has been further exacerbated by the post-COVID supply chain issues and the higher energy prices brought on by the Russia-Ukraine conflict.

10

11

12

13

14

15

16

Nonetheless, utilities took advantage of the low yields in 2020 and 2021 to raise record amounts of capital. The big economic issue is reported year-over-year inflation. However, while year-over-year inflation was high in the short-term, the yields on TIPS suggest that longer-term inflation expectations are still about 2.25%. As I noted above, with an inverted yield curve, the prospect of a recession is likely, which would lead to lower interest rates.

B. Authorized ROEs

1 **Q. PLEASE DISCUSS THE TREND IN AUTHORIZED ROES FOR ELECTRIC**
2 **AND GAS COMPANIES.**

3 A. In Figure 7, I graphed quarterly authorized ROEs for electric and gas companies from 2000
4 to 2023. Over the years, as interest rates have come down, authorized ROEs for electric
5 utility and gas distribution companies have slowly declined to reflect a low-capital-cost
6 environment. In 2020 and then again in 2021, authorized ROEs for utilities hit all-time
7 lows. The average annual authorized ROEs for electric utilities and gas distribution
8 companies for 2010–2023 are shown in Table 3 below.

9 **Figure 7**
Authorized ROEs for Electric Utilities and Gas Distribution Companies
2000–2023

Table 3
Average Annual Authorized ROEs for Electric Utilities
and Gas Distribution Companies
2010–2023

	Electric	Gas		Electric	Gas
2010	10.37	10.15	2017	9.74	9.72
2011	10.29	9.92	2018	9.6	9.59
2012	10.17	9.94	2019	9.66	9.72
2013	10.03	9.68	2020	9.44	9.47
2014	9.91	9.78	2021	9.38	9.56
2015	9.78	9.6	2022	9.54	9.53
2016	9.77	9.54	2023H	9.56	9.66

Data Source: S&P Global Market Intelligence, RRA Regulatory Focus, 2023.

3 **Q. DID THE HIGHER INTEREST RATES IN 2022 MEAN AUTHORIZED ROES**
4 **HAVE INCREASED SIGNIFICANTLY?**

5 A. No, not necessarily. As I noted above, authorized ROEs for utilities reached record low
6 levels in 2020 and 2021 due to record low interest rates and capital costs. However, utility
7 ROEs did not decline to the extent interest rates did over these two years. Figure 8 and
8 Table 4 show the average annual 30-year Treasury yields and authorized ROEs for electric
9 utilities and gas distribution companies. A key observation from Figure 8 and Table 4 is
10 that authorized ROEs for electric utilities, despite hitting record lows in 2020–2021, did
11 not decline nearly as much as interest rates. The daily 30-year Treasury yield averaged
12 2.85% in the two years 2018 and 2019, versus 1.81% in the two years 2020 and 2021, a
13 decrease of 104 basis points. However, the authorized ROEs for electric utilities averaged
14 9.63% in in the two years 2018 and 2019 and declined to an average of 9.41% in the two
15 years 2020 and 2021, a decline of only 22 basis points. In 2022, the average daily 30-year
16 Treasury yield increased by 105 basis points to 3.11%, while authorized ROEs increased
17 by only 16 basis points to 9.54%.

Figure 8
Authorized ROEs for Electric Utilities and 30-Year Treasury Yields
2007–2022

Average Annual 30-Year Treasury Yields and Authorized ROEs
for Electric Utility Companies
2018–2022

	2018	2019	2018-19 Average	2020	2021	2020-21 Average	2018-19 - 2020-21	2022	2022 Increase
30-Year Treasury Yield	3.11%	2.58%	2.85%	1.56%	2.06%	1.81%	1.04%	3.11%	1.05%
Average Electric ROE	9.60%	9.66%	9.63%	9.44%	9.38%	9.41%	0.22%	9.54%	0.16%

Q. PLEASE DISCUSS THE TREND IN AUTHORIZED ROES FOR ELECTRIC AND GAS COMPANIES IN KANSAS.

A. Table 5 shows the electric utilities and gas distribution companies in Kansas from 2010–2023 in which there was a specified authorized ROE. These authorized ROEs have been in the 9.10%–9.30% range over the past five years. In both of the Companies’ last rate cases in 2018, which were settlements, a ROE of 9.30% was authorized.

Table 5
Kansas Authorized ROEs
2010–2023

Company	TKR	Docket	Service	Type	Date	Decision	Rate Increase	Rate of Return	ROE	CE Ratio
Eversource Energy Kansas Central Inc.	EVRG	D-09-WSEE-925-RTS	Electric	Vertically Integrate	1/27/2010	Settled	8.6	8.49	10.40	50.13

Data Sources: S&P Global Market Intelligence, RRA *Regulatory Focus*, 2023.

1 **Q. DO YOU BELIEVE THAT YOUR ROE RECOMMENDATION MEETS THE**
 2 **HOPE AND BLUEFIELD STANDARDS?**

3 A. Yes, I do. As I noted previously, according to the *Hope* and *Bluefield* decisions, returns on
 4 capital should be: (1) comparable to returns investors expect to earn on other investments
 5 of similar risk; (2) sufficient to assure confidence in the company’s financial integrity; and
 6 (3) adequate to maintain and support the company’s credit and to attract capital.⁵ As page
 7 3 of Exhibit JRW-2 shows, in recent years, electric utilities and gas distribution companies
 8 have been earning ROEs in the range of 8.0% to 10.0%. With such an ROE, electric utilities
 9 and gas companies, such as those in the proxy group, have strong investment grade credit
 10 ratings, sell stocks well over book value, and raise abundant amounts of capital. While my
 11 recommendation is slightly below the average authorized ROE for electric utility and gas
 12 distribution companies, it reflects the relatively low levels of interest rates and capital costs
 13 in the current market. Therefore, I believe that my ROE recommendation meets the criteria
 14 *Hope* and *Bluefield* established.

⁵ *Fed. Power Comm’n v. Hope Natural Gas Co.*, 320 U.S. 591 (1944); *Bluefield Water Works and Improvement Co. v. Pub. Serv. Comm’n of W. Va.*, 262 U.S. 679 (1923).

1 **A. WITH RESPECT TO THIS DISCUSSION, PLEASE DISCUSS THE RECENT**
2 **WALL STREET JOURNAL ARTICLE ON UTILITIES’ AUTHORIZED ROES IN**
3 **THE CURRENT ENVIRONMENT.**

4 A. The article, entitled “Utilities Have a High-Wire Act Ahead,” discusses the issue utilities
5 are facing today to meet the needs of its primary stakeholders – customers and investors.⁶
6 In years past, utilities could invest and grow their rate bases without undue burden on
7 ratepayers because low interest rates and natural gas prices moderated rate increases.
8 However, the significant increase in natural gas prices and interest rates in 2022 means that
9 the environment of the past is over.⁷ Going forward, the greater financial burden on utility
10 customers associated with higher natural gas prices and interest rates will likely put
11 pressure on regulatory commissions to look hard at utility rate increase requests.

12 The article also highlights this utility rate issue in the context of a recent study on
13 rate of return regulation. Werner and Jarvis (2022) evaluated the authorized ROEs in 3,500
14 electric and gas rate case decisions in the U.S. from 1980-2021. They compare the allowed
15 ROE to a number of capital cost benchmarks (government and corporate bonds, CAPM
16 equity cost rate estimates, and U.S. authorized ROEs) and focused on three questions:

17 (1) To what extent are utilities being allowed to earn excess returns on equity by
18 their regulators?

19 (2) How has this return on equity affected utilities’ capital investment decisions?

20 (3) What impact has this had on the costs paid by consumers?⁸

⁶ Jinjoo Lee, “Utilities Have a High-Wire Act Ahead,” *Wall Street Journal*, October 9, 2022, p. C1.

⁷ Higher gas prices do not hurt the utilities because they are passed on to consumers in the form of higher rates.

⁸ Karl Dunkle Werner and Stephen Jarvis, “Rate of Return Regulation Revisited,” Working Paper, Energy Institute, University of California at Berkeley, 2022.

1 The authors reported the following empirical results:
2

- 3 (1) The real (inflation-adjusted) return regulators allow equity investors to earn has been
4 pretty steady over the last 40 years, while the many different cost of capital measures
5 have been declining;
6
7 (2) The gap between the authorized ROEs and the benchmarks suggest that regulators have
8 been approving ROEs that are from 0.50% - 5.50% above the cost of equity estimates;
9
10 (3) One potential explanation is that utilities have become riskier. However, the authors
11 find that utility credit ratings, on average, have not changed much over the past 40
12 years;
13
14 (4) An extra 1.0% of allowed ROE causes a utility's capital rate base to expand by an extra
15 5% on average. This supports the Averch-Johnson effect that utilities have the incentive
16 to overinvest in capital projects if they are earning an outsized return on those
17 investments;⁹
18
19 (5) Both the ROE requested by utilities and the return granted by regulators respond more
20 quickly to rises in market measures of capital cost than to declines. The time adjustment
21 for decreases is twice as long as for increases;
22
23 (6) Authorized ROEs tend to be approved at round numbers (1.0, 0.5, 0.25), with 10.0%
24 being the most common authorized ROE;
25
26 (7) Overall, based on the gap, consumers may be paying \$2-20 billion per year more than
27 if authorized ROEs had fallen in line with other capital market indicators; and
28
29 (8) The authors also indicate that their results are similar to those found in a previous study
30 by Rode and Fischback (2019).¹⁰
31

32 In summary, these results indicate that over the past four decades authorized ROEs
33 have not declined in line with capital costs and therefore past authorized ROEs have
34 overstated the actual cost of equity capital. Hence, the Commission should not be
35 concerned that my recommended ROE is below other authorized ROEs.

IV. PROXY GROUP SELECTION

1 **Q. PLEASE DESCRIBE YOUR APPROACH TO DEVELOPING A FAIR RATE OF**
2 **RETURN RECOMMENDATION FOR THE COMPANIES.**

3 A. To develop a fair rate of return recommendation for the Companies, I evaluated the return
4 requirements of investors on the common stock of a proxy group of publicly-held electric
5 utility companies (“Electric Proxy Group”). I also employed the group developed by Ms.
6 Bulkley (“Bulkley Proxy Group”).

7 **Q. PLEASE DESCRIBE YOUR PROXY GROUP OF ELECTRIC COMPANIES.**

8 A. The selection criteria for my Electric Proxy Group include the following:

- 9 (1) Receives at least 50% of revenues from regulated electric operations as
10 reported in its SEC Form 10-K Report;
- 11 (2) *Value Line Investment Survey* lists it as a U.S.-based electric utility;
- 12 (3) Holds an investment-grade corporate credit and bond rating;
- 13 (4) Has paid a cash dividend for the past six months, with no cuts or omissions;
- 14 (5) Is not involved in an acquisition of another utility and not the target of an
15 acquisition; and
- 16 (6) Its analysts’ long-term EPS growth rate forecasts are available from Yahoo,
17 S&P Cap IQ, and/or Zacks.

18 The Electric Proxy Group includes 24 companies. Page 1 of Exhibit JRW-3 provides
19 summary financial statistics for the proxy group, showing median operating revenues and
20 net plant among members of the Electric Proxy Group of \$8.28 billion and \$25.93 billion

1 respectively. On average, the Electric Proxy Group receives 83% of its revenues from
2 regulated electric operations, has a BBB+ bond rating from S&P's and a Baa2 rating from
3 Moody's, has a current average common equity ratio of 41.9%, and an average earned
4 return on common equity of 8.86%.

5 **Q. PLEASE DESCRIBE THE BULKLEY PROXY GROUP.**

6 A. Ms. Bulkley's group is smaller (16 utilities). Panel B of page one of Exhibit JRW-3
7 provides summary financial statistics for the Bulkley Proxy Group, showing median
8 operating revenues and net plant of \$6.08 billion and \$19.50 billion respectively. On
9 average, the Bulkley Proxy Group receives 82% of its revenues from regulated electric
10 operations, has a BBB+ bond rating from S&P's and a Baa2 rating from Moody's, has an
11 average common equity ratio of 43.2%, and an average earned return on common equity
12 of 10.28%.

13 **Q. HOW DOES THE INVESTMENT RISK OF THE COMPANIES COMPARE TO**
14 **THAT OF YOUR PROXY GROUPS?**

15 A. I believe bond ratings provide a good assessment of a company's investment risk. The
16 Companies' S&P and Moody's credit ratings are A- and Baa1 for EKC and A and Baa1
17 for EKM. The average S&P and Moody's issuer credit ratings for the two proxy groups
18 are BBB+ and Baa2. This indicates that the investment risk of the Companies is below the
19 average of the two proxy groups.

20 **Q. PLEASE DISCUSS THE RISK ANALYSIS YOU PERFORMED ON PAGE TWO**
21 **OF EXHIBIT JRW-3.**

22 A. On page two of Exhibit JRW-3, I use five different risk measures to assess the riskiness of

1 the two proxy groups: Beta (0.87 vs. 0.88), Financial Strength (A vs. A), Safety (1.7 vs.
2 1.7), Earnings Predictability (90 vs. 91), and Stock Price Stability (91 vs. 93). Overall,
3 these measures suggest that the investment risk of the two groups (1) is very low and (2) is
4 similar to each other.

V. CAPITAL STRUCTURE RATIOS AND DEBT COST RATES

5 **Q. WHAT ARE THE COMPANIES' RECOMMENDED CAPITAL STRUCTURE**
6 **AND SENIOR CAPITAL COST RATES FOR RATEMAKING PURPOSES?**

7 A. Panel A of Exhibit JRW-4 provides the Companies' proposed capital structure and debt
8 cost rates. Mr. Andrews has proposed capital structures consisting of 48.00% long-term
9 debt and 52.00% equity for EKM and 47.96% long-term debt and 52.04% equity for EKC.
10 Mr. Andrews has proposed long-term debt cost rates of 4.37% for EKM and 4.35% for
11 EKC.

12 **Q. PLEASE DISCUSS THE CAPITAL STRUCTURES OF THE COMPANIES IN THE**
13 **PROXY GROUPS.**

14 A. Page 1 of Exhibit JRW-3 provides the average common equity ratios for the companies in the
15 two proxy groups. As of December 31, 2022, the average common equity ratios for the
16 Electric Proxy Group and Bulkley Proxy Group were 41.9% and 43.2%, respectively. As
17 such, the average common equity ratios for the proxy group companies are much lower and
18 represent higher financial risk than the Companies' common equity ratio. That means the
19 Companies have proposed capital structures with more common equity and less financial
20 risk than the proxy groups.

1 **Q. IS IT APPROPRIATE TO USE THE COMMON EQUITY RATIOS OF THE**
2 **PARENT HOLDING COMPANIES RATHER THAN THE SUBSIDIARY**
3 **OPERATING UTILITIES FOR COMPARISON PURPOSES WITH THE**
4 **COMPANIES' PROPOSED CAPITALIZATION?**

5 A. Yes. It is appropriate to use the common equity ratios of the utility holding companies
6 because the *holding companies* are publicly traded, and their stocks are used in the cost of
7 equity capital studies. The equities of the *operating utilities* are not publicly traded, and
8 hence their stocks cannot be used to compute the cost of equity capital for the Companies.

9 **Q. IS IT APPROPRIATE TO INCLUDE SHORT-TERM DEBT IN THE**
10 **CAPITALIZATION IN COMPARING THE COMMON EQUITY RATIOS OF**
11 **THE HOLDING COMPANIES WITH THE COMPANIES' PROPOSED**
12 **CAPITALIZATION?**

13 A. Yes. Debt has a higher claim on the assets and earnings of the companies than common
14 equity and requires timely payment of interest and repayment of principal. Thus, in
15 comparing the common equity ratios of the holding companies with the Companies'
16 recommendation, it is appropriate to include short-term debt when computing the holding
17 companies' common equity ratios. Additionally, the financial risk of a company is based
18 on total debt, which includes both short-term and long-term debt.

19 **Q. PLEASE DISCUSS THE SIGNIFICANCE OF THE AMOUNT OF EQUITY THAT**
20 **IS INCLUDED IN A UTILITY'S CAPITAL STRUCTURE.**

21 A. A utility's decision as to the amount of equity capital it will incorporate into its capital
22 structure involves fundamental trade-offs relating to the amount of financial risk the firm

1 carries, the return on equity that investors will require, and the overall revenue requirement
2 its customers are required to bear through the rates they pay.

3 **Q. PLEASE DISCUSS A UTILITY’S DECISION TO USE DEBT VERSUS EQUITY**
4 **TO MEET ITS CAPITAL NEEDS.**

5 A. Utilities satisfy their capital needs through a mix of equity and debt. Because equity capital
6 is more expensive than debt, the issuance of debt enables a utility to raise more capital for
7 a given commitment of dollars than it could raise with just equity. Debt is, therefore, a
8 means of “leveraging” capital dollars. However, as the amount of debt in the capital
9 structure increases, its financial risk increases and the risk of the utility, as perceived by
10 equity investors, also increases. Significantly for this case, the converse is also true. As
11 the amount of debt in the capital structure decreases, the financial risk decreases. The
12 required return on equity capital is a function of the amount of overall risk that investors
13 perceive, including financial risk in the form of debt.

14 **Q. WHY IS THIS RELATIONSHIP IMPORTANT TO THE UTILITY’S**
15 **CUSTOMERS?**

16 A. Just as there is a direct correlation between the utility’s authorized ROE and the utility’s
17 revenue requirement (the higher the return, the greater the revenue requirement), there is a
18 direct correlation between the amount of equity in the capital structure and the revenue
19 requirement the customers are called on to bear. Again, equity capital is more expensive
20 than debt. Not only does equity command a higher cost rate, but it also adds more to the
21 income tax burden that ratepayers are required to pay through rates. As the equity ratio
22 increases, the utility’s revenue requirement increases, and the rates paid by customers

1 increase. If the proportion of equity is too high, rates will be higher than they need to be.
2 For this reason, the utility's management should pursue a capital acquisition strategy that
3 results in the proper balance in the capital structure to minimize the overall cost of capital.

4 **Q. HOW HAVE UTILITIES TYPICALLY STRUCK THIS BALANCE?**

5 A. Due to regulation and the essential nature of its output, a regulated utility is exposed to less
6 business risk than other companies that are not regulated. This means that a regulated
7 electric distribution company can reasonably carry relatively more debt in its capital
8 structure than can most unregulated companies. Thus, a utility should take appropriate
9 advantage of its lower business risk to employ cheaper debt capital at a level that will
10 benefit its customers through lower revenue requirements. Typically, one may see equity
11 ratios for electric utilities range from 40% to 50%.

12 **Q. GIVEN THAT THE COMPANIES HAVE PROPOSED AN EQUITY RATIO THAT**
13 **IS HIGHER THAN THAT OF THE PROXY GROUP, WHAT SHOULD THE**
14 **COMMISSION DO IN THIS RATEMAKING PROCEEDING?**

15 A. When a regulated utility's actual capital structure contains a high equity ratio, the options
16 are: (1) to impute a more reasonable capital structure that is comparable to that of the proxy
17 group and to reflect the imputed capital structure in revenue requirements; or (2) to
18 recognize the downward impact that an unusually high equity ratio will have on the
19 financial risk of a utility and authorize a lower common equity cost rate than that for the
20 proxy group.

1 **Q. PLEASE COMMENT ON MS. BULKLEY’S CAPITAL STRUCTURE STUDY**
2 **FOUND IN EXHIBIT AEB-12.**

3 A. Ms. Bulkley claims to support the Companies’ proposed capital structure in a study she
4 performed in Exhibit AEB-12. She reports that the operating companies owned by her 16
5 proxy utilities have a common equity ratio of 52.58%, which is similar to the capitalizations
6 proposed by the Companies. The error is that the operating companies are not the proxy
7 utility companies. The proxy utilities are the holding companies that own the operating
8 companies. As shown in Exhibit JRW-3, the average common equity ratio for the parent
9 holding companies as of December 31, 2022, was 43.2%. Hence, her study does not support
10 the Companies’ proposed capital structures.

11 **Q. GIVEN THIS DISCUSSION, WHAT CAPITALIZATION RATIOS AND CAPITAL**
12 **COST RATES ARE YOU RECOMMENDING FOR THE COMPANIES?**

13 A. As noted above, the S&P and Moody’s credit ratings of A- and Baa1 for EKC and A and
14 Baa1 for EKM are superior to the averages of the proxy groups. The Companies received
15 these credit ratings after the merger agreement was finalized, and the Companies received
16 their own separate capitalizations. In the Companies’ last two rate cases in 2018, which
17 were settlements, EKM and EKC agreed to capital structures with common equity ratios
18 of 49.09% and 51.24%, respectively. They have operated with these capitalizations since
19 that time and have maintained their credit ratings. Hence, I am employing the capital
20 structures adopted in the Companies’ last rate cases. I have adopted the Companies’
21 proposed long-term debt cost rates.

VI. THE COST OF COMMON EQUITY CAPITAL

A. Overview

1 **Q. WHY MUST AN OVERALL COST OF CAPITAL OR FAIR RATE OF RETURN**
2 **BE ESTABLISHED FOR A PUBLIC UTILITY?**

3 A. In a competitive industry, the return on a firm's common equity capital is determined
4 through the competitive market for its goods and services. Due to the capital requirements
5 needed to provide utility services and the economic benefit to society from avoiding
6 duplication of these services and the construction of utility infrastructure, most public
7 utilities are monopolies. Because of the lack of competition and the essential nature of
8 their services, it is not appropriate to permit monopoly utilities to set their own prices.
9 Thus, regulation seeks to establish prices that are fair to consumers and, at the same time,
10 sufficient to meet the operating and capital costs of the utility, *i.e.*, provide an adequate
11 return on capital to attract investors.

12 **Q. PLEASE PROVIDE AN OVERVIEW OF THE COST OF CAPITAL IN THE**
13 **CONTEXT OF THE THEORY OF THE FIRM.**

14 A. The total cost of operating a business includes the cost of capital. The cost of common-
15 equity capital is the expected return on a firm's common stock that the marginal investor
16 would deem sufficient to compensate for risk and the time value of money. In equilibrium,
17 the expected and required rates of return on a company's common stock are equal.

18 Normative economic models of a company or firm, developed under very
19 restrictive assumptions, provide insight into the relationship between a firm's performance

1 or profitability, capital costs, and the value of the firm. Under the economist’s ideal model
2 of perfect competition — where entry and exit are costless, products are undifferentiated,
3 and there are increasing marginal costs of production — firms produce up to the point
4 where price equals marginal cost. Over time, a long-run equilibrium is established where
5 the price of the firm equals average cost, including the firm’s capital costs. In equilibrium,
6 total revenues equal total costs, and because capital costs represent investors’ required
7 return on the firm’s capital, actual returns equal required returns, and the market value must
8 equal the book value of the firm’s securities.

9 In a competitive market, firms can achieve competitive advantage due to product-
10 market imperfections. Most notably, companies can gain competitive advantage through
11 product differentiation (adding real or perceived value to products) and by achieving
12 economies of scale (decreasing marginal costs of production). Competitive advantage
13 allows firms to price products above average cost and thereby earn accounting profits
14 greater than those required to cover capital costs. When these profits are in excess of those
15 required by investors, or when a firm earns an ROE in excess of its cost of equity, investors
16 respond by valuing the firm’s equity in excess of its book value.

17 James M. McTaggart, founder of the international management consulting firm
18 Marakon Associates, described this essential relationship between the ROE, the cost of
19 equity, and the market-to-book ratio in the following manner:

20 Fundamentally, the value of a company is determined by the cash flow
21 it generates over time for its owners, and the minimum acceptable rate
22 of return required by capital investors. This “cost of equity capital” is
23 used to discount the expected equity cash flow, converting it to a present
24 value. The cash flow is, in turn, produced by the interaction of a
25 company’s return on equity and the annual rate of equity growth. High

1 return on equity (ROE) companies in low-growth markets, such as
2 Kellogg, are prodigious generators of cash flow, while low ROE
3 companies in high-growth markets, such as Texas Instruments, barely
4 generate enough cash flow to finance growth.

5 A company's ROE over time, relative to its cost of equity, also
6 determines whether it is worth more or less than its book value. If its
7 ROE is consistently greater than the cost of equity capital (the investor's
8 minimum acceptable return), the business is economically profitable
9 and its market value will exceed book value. If, however, the business
10 earns an ROE consistently less than its cost of equity, it is economically
11 unprofitable and its market value will be less than book value.¹¹
12

13 As such, the relationship between a firm's ROE, cost of equity, and market-to-book
14 ratio is relatively straightforward. A firm that earns an ROE above its cost of equity will
15 see its common stock sell at a price above its book value. Conversely, a firm that earns an
16 ROE below its cost of equity will see its common stock sell at a price below its book value.

17 **Q. PLEASE PROVIDE ADDITIONAL INSIGHTS INTO THE RELATIONSHIP**
18 **BETWEEN ROE AND MARKET-TO-BOOK RATIOS.**

19 A. This relationship is discussed in a classic Harvard Business School case study entitled
20 "Note on Value Drivers." On page 2 of that case study, the author describes the relationship
21 very succinctly:

22 For a given industry, more profitable firms – those able to generate higher returns
23 per dollar of equity – should have higher market-to-book ratios. Conversely, firms
24 which are unable to generate returns in excess of their cost of equity [(K)] should
25 sell for less than book value.¹²

<u>Profitability</u>	<u>Value</u>
If $ROE > K$	then $Market/Book > 1$
If $ROE = K$	then $Market/Book = 1$
If $ROE < K$	then $Market/Book < 1$

¹¹ James M. McTaggart, "The Ultimate Poison Pill: Closing the Value Gap," *Commentary* (Spring 1986), p. 3.

¹² Benjamin C. Esty, *Note on Value Drivers*, HARVARD BUSINESS SCHOOL BACKGROUND NOTE 297-082, April 1997.

1 To assess the relationship by industry, as suggested above, I performed a regression
2 study between estimated ROE and market-to-book ratios of the Electric Proxy Group
3 companies. The results are presented in Figure 9. The average R-square is 0.58.¹³ This
4 demonstrates the strong positive relationship between ROEs and market-to-book ratios for
5 public utilities. Given that the market-to-book ratios have been above 1.0 for a number of
6 years, this also demonstrates that utilities have been earning ROEs above the cost of equity
7 capital for many years.

8 **Figure 9**
The Relationship Between Expected ROE and Market-to-Book Ratios
Electric Proxy Group

9 **Q. WHAT FACTORS DETERMINE INVESTORS' EXPECTED OR REQUIRED**
10 **RATE OF RETURN ON EQUITY?**

11 **A.** The expected or required rate of return on common stock is a function of market-wide as
12 well as company-specific factors. The most important market factor is the time value of

¹³ R-square measures the percent of variation in one variable (e.g., market-to-book ratios) explained by another variable (e.g., expected ROE). R-squares vary between 0 and 1.0, with values closer to 1.0 indicating a higher relationship between two variables.

1 money, as indicated by the level of interest rates in the economy. Common-stock investor
2 requirements generally increase and decrease with like changes in interest rates. The
3 perceived risk of a firm is the predominant factor that influences investor return
4 requirements on a company-specific basis. A firm's investment risk is often separated into
5 business risk and financial risk. Business risk encompasses all factors that affect a firm's
6 operating revenues and expenses. Financial risk results from incurring fixed obligations in
7 the form of debt in financing its assets.

8 **Q. HOW DOES THE INVESTMENT RISK OF UTILITIES COMPARE WITH THAT**
9 **OF OTHER INDUSTRIES?**

10 A. Due to the essential nature of their service as well as their regulated status, public utilities
11 are exposed to a lesser degree of business risk than other non-regulated businesses. The
12 relatively low level of business risk allows public utilities to meet much of their capital
13 requirements through borrowing in the financial markets, thereby incurring greater than
14 average financial risk. Nonetheless, the overall investment risk of public utilities is below
15 most other industries.

16 Table 6 provides an assessment of investment risk for 92 industries as measured by
17 beta, which, according to modern capital market theory, is the only relevant measure of
18 investment risk. These betas come from the *Value Line Investment Survey*. The study
19 shows that the investment risk of utilities is low compared to other industries.¹⁴ The
20 average betas for electric, gas, and water utility companies are 0.89, 0.87, and 0.78,

¹⁴ As I discuss in more detail below, a stock whose price movement is greater than that of the market, such as a technology stock, is riskier than the market and has a beta greater than 1.0. A stock with below-average price movement, such as that of a regulated public utility, is less risky than the market and has a beta less than 1.0.

1 respectively.¹⁵ As such, the cost of equity for utilities is among the lowest of all industries
 2 in the U.S., based on modern capital market theory.

* Industry averages for 92 industries using Value Line's database of 1,705 companies - Updated 1-15-23.

** Value Line computes betas using monthly returns regressed against the New York Stock Exchange Index for five years. These betas are then adjusted as follows: VL Beta = $\{(2/3) * \text{Regressed Beta}\} + \{(1/3) * (1.0)\}$ to account to tendency for Betas to regress toward average of 1.0. See M. Blume, "On the Assessment of Risk," *Journal of Finance*, March 1971.

¹⁵ The beta for the Value Line electric utilities is the simple average of Value Line's Electric East (0.89), Central (0.88), and West (0.89) group betas.

1 **Q. WHAT IS THE COST OF COMMON EQUITY CAPITAL?**

2 A. The costs of debt and preferred stock are normally based on historical or book values and
3 can be determined with a great degree of accuracy. The cost of common equity capital,
4 however, cannot be determined precisely and must instead be estimated from market data
5 and informed judgment. This return requirement of the stockholder should be
6 commensurate with the return requirement on investments in other enterprises having
7 comparable risks.

8 According to valuation principles, the present value of an asset equals the
9 discounted value of its expected future cash flows. Investors discount these expected cash
10 flows at their required rate of return that, as noted above, reflects the time value of money
11 and the perceived riskiness of the expected future cash flows. As such, the cost of common
12 equity is the rate at which investors discount expected cash flows associated with common
13 stock ownership.

14 **Q. HOW CAN THE EXPECTED OR REQUIRED RATE OF RETURN ON COMMON**
15 **EQUITY CAPITAL BE DETERMINED?**

16 A. Models have been developed to ascertain the cost of common equity capital for a firm.
17 Each model, however, has been developed using restrictive economic assumptions.
18 Consequently, judgment is required in selecting appropriate financial valuation models to
19 estimate a firm's cost of common equity capital, in determining the data inputs for these
20 models, and in interpreting the models' results. All of these decisions must take into
21 consideration the firm involved as well as current conditions in the economy and the
22 financial markets.

1 **Q. HOW DID YOU ESTIMATE THE COST OF EQUITY CAPITAL FOR THE**
2 **COMPANIES?**

3 A. Primarily, I rely on the DCF model to estimate the cost-of-equity capital. Given the
4 investment-valuation process and the relative stability of the utility business, the DCF
5 model provides the best measure of equity cost rates for public utilities. I have also
6 performed an analysis using the CAPM; however, I give these results less weight because
7 I believe that risk-premium studies, of which the CAPM is one form, provide a less reliable
8 indication of equity-cost rates for public utilities.

9 **Q. PLEASE EXPLAIN WHY YOU BELIEVE THAT THE CAPM PROVIDES A LESS**
10 **RELIABLE INDICATOR OF EQUITY COST RATES.**

11 A. I believe that the CAPM provides a less reliable measure of a utility's equity-cost rate
12 because it requires an estimate of the market-risk premium. As discussed below, there is a
13 wide variation in estimates of the market-risk premium found in studies by academics and
14 investment firms, as well as in surveys of market professionals.

B. Discounted Cash Flow (DCF) Approach

15 **Q. PLEASE DESCRIBE THE THEORY BEHIND THE TRADITIONAL DCF**
16 **MODEL.**

17 A. According to the DCF model, the current stock price is equal to the discounted value of all
18 future dividends that investors expect to receive from investment in the firm. As such,
19 stockholders' returns ultimately result from current as well as future dividends. As owners

1 of a corporation, common stockholders are entitled to a *pro rata* share of the firm's
2 earnings. The DCF model presumes that earnings that are not paid out in the form of
3 dividends are reinvested in the firm to provide for future growth in earnings and dividends.
4 The rate at which investors discount future dividends, which reflects the timing and
5 riskiness of the expected cash flows, is interpreted as the market's expected or required
6 return on the common stock. Therefore, this discount rate represents the cost of common
7 equity. Algebraically, the DCF model can be expressed as:

$$P = \frac{D_1}{(1+k)^1} + \frac{D_2}{(1+k)^2} + \dots + \frac{D_n}{(1+k)^n}$$

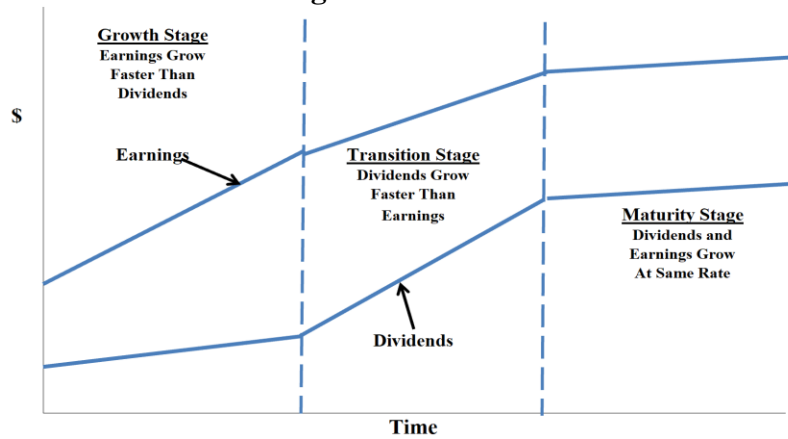

8
9 where P is the current stock price, D₁, D₂, D_n are the dividends in (respectively) year 1, 2,
10 and in the future years n, and k is the cost of common equity.

11 **Q. IS THE DCF MODEL CONSISTENT WITH VALUATION TECHNIQUES**
12 **EMPLOYED BY INVESTMENT FIRMS?**

13 A. Yes. Virtually all investment firms use some form of the DCF model as a valuation
14 technique. One common application for investment firms is called the three-stage DCF or
15 dividend discount model ("DDM"). The stages in a three-stage DCF model are shown in
16 Figure 10. This model presumes that a company's dividend payout progresses initially
17 through a growth stage, then proceeds through a transition stage, and finally assumes a
18 maturity (or steady-state) stage. The dividend-payment stage of a firm depends on the
19 profitability of its internal investments, which, in turn, is largely a function of the life cycle
20 of the product or service.

1

Figure 10
The Three-Stage Dividend Discount Model

2

- 3 1. **Growth stage:** Characterized by rapidly expanding sales, high profit margins, and
4 an abnormally high growth in earnings per share. Because of highly profitable
5 expected investment opportunities, the payout ratio is low. Competitors are
6 attracted by the unusually high earnings, leading to a decline in the growth rate.
- 7 2. **Transition stage:** In later years, increased competition reduces profit margins and
8 earnings growth slows. With fewer new investment opportunities, the company
9 begins to pay out a larger percentage of earnings.
- 10 3. **Maturity (steady-state) stage:** Eventually, the company reaches a position where
11 its new investment opportunities offer, on average, only slightly more attractive
12 ROEs. At that time, its earnings growth rate, payout ratio, and ROE stabilize for
13 the remainder of its life. As I will explain below, the constant-growth DCF model
14 is appropriate when a firm is in the maturity stage of the life cycle.¹⁶

15

16 In using the three-stage model to estimate a firm's cost of equity capital, dividends
17 are projected into the future using the different growth rates in the alternative stages, and
18 then the equity-cost rate is the discount rate that equates the present value of the future
19 dividends to the current stock price.

20 **Q. PLEASE BRIEFLY EXPLAIN THE CONCEPT OF "PRESENT VALUE."**

21 **A.** Present value is the concept that an amount of money today is worth more than that same
22 amount in the future. In other words, money received in the future is not worth as much

¹⁶ William Sharpe, Gordon Alexander, and Jeffer Bailey, *Investments*, 1995, pp. 590-1.

1 as an equal amount received today. Present value tells an investor how much he or she
2 would need in today's dollars to earn a specific amount in the future.

3 **Q. HOW DO YOU ESTIMATE STOCKHOLDERS' EXPECTED OR REQUIRED**
4 **RATE OF RETURN USING THE DCF MODEL?**

5 A. Under certain assumptions, including a constant and infinite expected growth rate, and
6 constant dividend/earnings and price/earnings ratios, the DCF model can be simplified to
7 the following:

$$8 \quad P = \frac{D_1}{k - g}$$

9 where P is the current stock price, D_1 represents the expected dividend over the coming
10 year, k is investor's required return on equity, and g is the expected growth rate of
11 dividends. This is known as the constant-growth version of the DCF model. To use the
12 constant-growth DCF model to estimate a firm's cost of equity, one solves for "k" in the
13 above expression to obtain the following:

$$14 \quad k = \frac{D_1}{P} + g$$

15 **Q. IN YOUR OPINION, IS THE CONSTANT-GROWTH DCF MODEL**
16 **APPROPRIATE FOR PUBLIC UTILITIES?**

17 A. Yes. The economics of the public utility business indicate that the industry is in the steady-
18 state or constant-growth stage of a three-stage DCF. The economics include the relative
19 stability of the utility business, the maturity of the demand for public utility services, and
20 the regulated status of public utilities (especially the fact that, as monopolies, their returns
21 on investment are effectively set through the ratemaking process). The DCF valuation

1 procedure for companies in this stage is the constant-growth DCF. In the constant-growth
2 version of the DCF model, the current dividend payment and stock price are directly
3 observable. However, the primary problem and controversy in applying the DCF model to
4 estimate equity-cost rates entails estimating investors' expected dividend growth rate.

5 **Q. WHAT FACTORS SHOULD ONE CONSIDER WHEN APPLYING THE DCF**
6 **METHODOLOGY?**

7 A. One should be sensitive to several factors when using the DCF model to estimate a firm's
8 cost of equity capital. In general, one must recognize the assumptions under which the
9 DCF model was developed in estimating its components (the dividend yield and the
10 expected growth rate). The dividend yield can be measured precisely at any point in time;
11 however, it tends to vary somewhat over time. Estimation of expected growth is
12 considerably more difficult. One must consider recent firm performance, in conjunction
13 with current economic developments and other information available to investors, to
14 accurately estimate investors' expectations.

15 **Q. WHAT DIVIDEND YIELDS HAVE YOU REVIEWED?**

16 A. I have calculated the dividend yields for the companies in the proxy groups using the
17 current annual dividend and the 30-day, 90-day, and 180-day average stock prices. These
18 dividend yields are provided in Panels A and B of page 2 of Exhibit JRW-5. I have shown
19 the mean and median dividend yields using 30-day, 90-day, and 180-day average stock prices.
20 For the Electric Proxy Group, the dividend yields range from 3.70% to 3.90%. I will use
21 the midpoint of this range, 3.80%, as the dividend yield for the Electric Proxy Group.¹⁷

¹⁷ For the dividend yields and ROEs, I round to the nearest .05%.

1 For the Bulkley Proxy Group, the dividend yield results range from 3.60% to 3.90%. I will
2 use the midpoint of this range, 3.75%, as the dividend yield for the Bulkley Proxy Group.

3 **Q. PLEASE DISCUSS THE APPROPRIATE ADJUSTMENT TO THE SPOT**
4 **DIVIDEND YIELD.**

5 A. According to the traditional DCF model, the dividend yield term relates the dividend paid
6 over the coming period to the current stock price. As indicated by Professor Myron
7 Gordon, who is commonly associated with the development of the DCF model for popular
8 use, this is obtained by: (1) multiplying the expected dividend over the coming quarter by
9 4, and (2) dividing this dividend by the current stock price to determine the appropriate
10 dividend yield for a firm that pays dividends on a quarterly basis.¹⁸

11 In applying the DCF model, some analysts adjust the current dividend for growth
12 over the coming year as opposed to the coming quarter. This can be complicated because
13 firms tend to announce changes in dividends at different times during the year. As such,
14 computing the dividend yield based on presumed growth over the coming quarter as
15 opposed to the coming year can produce quite different results. Consequently, it is
16 common for analysts to adjust the dividend yield by some fraction of the long-term
17 expected growth rate.

18 **Q. GIVEN THIS DISCUSSION, WHAT ADJUSTMENT FACTOR DO YOU USE FOR**
19 **YOUR DIVIDEND YIELD?**

20 A. I adjust the dividend yield by one-half (1/2) of the expected growth to reflect growth over
21 the coming year. The DCF equity-cost rate (“K”) is computed as:

¹⁸ *Petition for Modification of Prescribed Rate of Return*, Federal Communications Commission, Docket No. 79-05, Direct Testimony of Myron J. Gordon and Lawrence I. Gould at 62 (April 1980).

1
$$K = \left[\left(\frac{D}{P} \right) \times (1 + 0.5g) \right] + g$$

2 **Q. PLEASE DISCUSS THE GROWTH RATE COMPONENT OF THE DCF MODEL.**

3 A. There is debate as to the proper methodology to employ in estimating the growth
4 component of the DCF model. By definition, this component is investors' expectations of
5 the long-term dividend growth rate. Presumably, investors use some combination of
6 historical and/or projected growth rates for earnings and dividends per share and for
7 internal or book-value growth to assess long-term potential.

8 **Q. WHAT GROWTH DATA HAVE YOU REVIEWED FOR THE PROXY GROUPS?**

9 A. I have analyzed a number of measures of growth for companies in the proxy groups. I
10 reviewed *Value Line's* historical and projected growth-rate estimates for EPS, dividends
11 per share ("DPS"), and book value per share ("BVPS"). In addition, I utilized the average
12 EPS growth-rate forecasts of Wall Street analysts as provided by Yahoo, Zacks, and S&P
13 Cap IQ. These services solicit five-year earnings growth-rate projections from securities
14 analysts and compile and publish the means and medians of these forecasts. Finally, I also
15 assessed prospective growth as measured by prospective earnings retention rates and
16 earned returns on common equity.

17 **Q. PLEASE DISCUSS HISTORICAL GROWTH IN EARNINGS AND DIVIDENDS,
18 AS WELL AS INTERNAL GROWTH.**

19 A. Historical growth rates for EPS, DPS, and BVPS are readily available to investors and are
20 presumably an important ingredient in forming expectations concerning future growth.
21 However, one must use historical growth numbers as measures of investors' expectations
22 with caution. In some cases, past growth may not reflect future growth potential. Also,

1 employing a single growth-rate number (for example, for five or ten years) is unlikely to
2 accurately measure investors' expectations, due to the sensitivity of a single growth-rate
3 figure to fluctuations in individual firm performance as well as overall economic
4 fluctuations (*i.e.*, business cycles). Thus, one must appraise the context in which the growth
5 rate is being employed. According to the conventional DCF model, the expected return on
6 a security is equal to the sum of the dividend yield and the expected long-term growth in
7 dividends. Therefore, to best estimate the cost of common-equity capital using the
8 conventional DCF model, one must look to long-term growth rate expectations.

9 **Q. PLEASE DEFINE AND EXPLAIN THE RELEVANCE OF INTERNAL GROWTH.**

10 A. A company's internal (or "organic") growth occurs when a business expands its own
11 operations rather than relying on takeovers and mergers. It can come about through various
12 means, for example, increasing existing production capacity through investment in new
13 capital and technology, or development and launch of new products.

14 Internally generated growth is a function of the percentage of earnings retained
15 within the firm (the earnings retention rate) and the rate of return earned on those earnings
16 (the ROE). The internal growth rate is computed as the retention rate times the ROE.
17 Internal growth is significant in determining long-run earnings and, therefore, dividends.
18 Investors recognize the importance of internally-generated growth and pay premiums for
19 stocks of companies that retain earnings and earn high returns on internal investments.

1 **Q. PLEASE DISCUSS THE SERVICES THAT PROVIDE ANALYSTS' EPS**
2 **FORECASTS.**

3 A. Analysts' EPS forecasts for companies are collected and published by several different
4 investment information services, including Institutional Brokers Estimate System
5 ("I/B/E/S"), Bloomberg, FactSet, S&P Cap IQ, Zacks, First Call, and Reuters, among
6 others. Thomson Reuters publishes analysts' EPS forecasts under different product names,
7 including I/B/E/S, First Call, and Reuters. Bloomberg, FactSet, S&P Cap IQ, and Zacks
8 each publish their own set of analysts' EPS forecasts for companies. These services do not
9 reveal (1) the analysts who are solicited for forecasts; or (2) the identity of the analysts who
10 actually provide the EPS forecasts that are used in the compilations published by the
11 services. I/B/E/S, Bloomberg, FactSet, S&P Cap IQ, and First Call are fee-based services.
12 These services usually provide detailed reports and other data in addition to analysts' EPS
13 forecasts. In contrast, Thomson Reuters and Zacks provide limited EPS forecast data free-
14 of-charge on the Internet. Yahoo finance (<http://finance.yahoo.com>) lists Thomson Reuters
15 as the source of its summary EPS forecasts. Zacks (www.zacks.com) publishes its summary
16 forecasts on its website. Zacks estimates are also available on other websites, such as
17 MSN.Money (<http://money.msn.com>).

18 **Q. ARE YOU RELYING EXCLUSIVELY ON THE EPS FORECASTS OF WALL**
19 **STREET ANALYSTS IN ARRIVING AT A DCF GROWTH RATE FOR THE**
20 **PROXY GROUP?**

21 A. No. There are several issues with using the EPS growth rate forecasts of Wall Street
22 analysts as DCF growth rates. First, the appropriate growth rate in the DCF model is the

1 dividend growth rate, not the earnings growth rate. Nonetheless, over the very long term,
2 dividend and earnings will have to grow at a similar rate. Therefore, consideration must
3 be given to other indicators of growth, including prospective dividend growth, internal
4 growth, as well as projected earnings growth. Second, a study by Lacina, Lee, and Xu
5 (2011) has shown that analysts' three-to-five year EPS growth-rate forecasts are not more
6 accurate at forecasting future earnings than naïve random walk forecasts of future
7 earnings.¹⁹ Employing data over a twenty-year period, these authors demonstrate that
8 using the most recent year's actual EPS figure to forecast EPS in the next three-to-five
9 years proved to be just as accurate as using the EPS estimates from analysts' three-to-five
10 year EPS growth-rate forecasts. In the authors' opinion, these results indicate that analysts'
11 long-term earnings growth-rate forecasts should be used with caution as inputs for
12 valuation and cost of capital purposes. Finally, and most significantly, it is well known
13 that the long-term EPS growth-rate forecasts of Wall Street securities analysts are overly
14 optimistic and upwardly biased. This has been demonstrated in a number of academic
15 studies over the years.²⁰ Hence, using these growth rates as a DCF growth rate will provide
16 an overstated equity cost rate. On this issue, a study by Easton and Sommers (2007) found

¹⁹ M. Lacina, B. Lee & Z. Xu, *Advances in Business and Management Forecasting (Vol. 8)*, Kenneth D. Lawrence, Ronald K. Klimberg (ed.), Emerald Group Publishing Limited, pp. 77-101. According to random walk theory in this context, annual changes in earnings are normally distributed and are independent of each other. Therefore, the theory presumes the past movement or trend of earnings cannot be used to predict its future earnings.

²⁰ The studies that demonstrate analysts' long-term EPS forecasts are overly-optimistic and upwardly biased include: R.D. Harris, "The Accuracy, Bias, and Efficiency of Analysts' Long Run Earnings Growth Forecasts," *Journal of Business Finance & Accounting*, pp. 725-55 (June/July 1999); P. DeChow, A. Hutton, and R. Sloan, "The Relation Between Analysts' Forecasts of Long-Term Earnings Growth and Stock Price Performance Following Equity Offerings," *Contemporary Accounting Research* (2000); K. Chan, L., Karceski, J., & Lakonishok, J., "The Level and Persistence of Growth Rates," *Journal of Finance*, pp. 643-684, (2003); M. Lacina, B. Lee, and Z. Xu, *Advances in Business and Management Forecasting (Vol. 8)*, Kenneth D. Lawrence, Ronald K. Klimberg (ed.), Emerald Group Publishing Limited, pp.77-101; and Marc H. Goedhart, Rishi Raj, and Abhishek Saxena, "Equity Analysts, Still Too Bullish," *McKinsey on Finance*, pp. 14-17, (Spring 2010).

1 that optimism in analysts' growth rate forecasts leads to an upward bias in estimates of the
2 cost of equity capital of almost 3.0 percentage points.²¹

3 **Q. ARE ANALYSTS' PROJECTED EPS GROWTH RATES FOR ELECTRIC**
4 **UTILITIES LIKEWISE OVERLY OPTIMISTIC AND UPWARDLY BIASED?**

5 A. Yes. I have completed a study of the accuracy of analysts' EPS growth rates for electric
6 utilities and gas distribution companies over the 1985 to 2022 time period. In the study, I
7 used the utilities listed in the electric utilities and gas distribution companies covered by
8 *Value Line*. I collected the three-to-five-year projected EPS growth rate from I/B/E/S for
9 each utility and compared that growth rate to the utility's actual subsequent three-to-five-
10 year EPS growth rate. As shown in Figure 11, the mean forecasted EPS growth rate
11 (depicted in the red line in Figure 11) is consistently greater than the achieved actual EPS
12 growth rate over the time period, with the exception of a few short periods. Over the entire
13 period, the mean forecasted EPS growth rate is over 200 basis points above the actual EPS
14 growth rate. As such, the projected EPS growth rates for electric utilities are overly
15 optimistic and upwardly based.

²¹ Peter D. Easton & Gregory A. Sommers, *Effect of Analysts' Optimism on Estimates of the Expected Rate of Return Implied by Earnings Forecasts*, 45 J. ACCT. RES. 983-1015 (2007).

Figure 11
Mean Forecasted vs. Actual Long-Term EPS Growth Rates
Electric Utilities and Gas Distribution Companies
1985–2022

Data Source: S&P Global Market Intelligence, Capital IQ, I/B/E/S, 2023.

2 **Q. ARE THE PROJECTED EPS GROWTH RATES OF VALUE LINE ALSO**
3 **OVERLY OPTIMISTIC AND UPWARDLY BIASED?**

4 A. Yes. A study by Szakmary, Conover, and Lancaster (“SCL”) (2008) evaluated the
5 accuracy of *Value Line*’s three-to-five-year EPS growth rate forecasts using companies in
6 the Dow Jones Industrial Average over a thirty-year time period and found these forecasted
7 EPS growth rates to be significantly higher than the EPS growth rates that these companies
8 subsequently achieved.²² SCL studied the predicted versus the projected stock returns,
9 sales, profit margins, and earnings per share made by *Value Line* over the 1969 to 2001
10 time period. *Value Line* projects variables from a three-year base period (e.g., 2012 to
11 2014) to a future three-year projected period (e.g., 2016 to 2018). SCL used the 65 stocks
12 included in the Dow Jones Indexes (30 Industrials, 20 Transports and 15 Utilities). SCL
13 found that the projected annual stock returns for the Dow Jones stocks were “incredibly

²² Szakmary, A., Conover, C., & Lancaster, C., *An Examination of Value Line’s Long-Term Projections*, J. BANKING & FIN., May 2008, at 820–33.

1 overoptimistic” and of no predictive value. The mean annual stock return of 20% for the
2 Dow Jones stocks’ *Value Line*’s forecasts was nearly double the realized annual stock
3 return. The authors also found that *Value Line*’s forecasts of EPS and profit margins were
4 “strikingly overoptimistic.” *Value Line*’s forecasts of annual sales were higher than
5 achieved levels, but not statistically significant. SCL concluded that the overly optimistic
6 projected annual stock returns were attributable to *Value Line*’s upwardly biased forecasts
7 of EPS and profit margins.

8 **Q. IS IT YOUR OPINION THAT STOCK PRICES REFLECT THE UPWARD BIAS**
9 **IN THE EPS GROWTH RATE FORECASTS?**

10 A. Yes, I do believe that investors are well aware of the bias in analysts’ EPS growth-rate
11 forecasts, and therefore, stock prices reflect the upward bias.

12 **Q. HOW DOES THAT AFFECT THE USE OF THESE FORECASTS IN A DCF**
13 **EQUITY COST RATE STUDY?**

14 A. According to the DCF model, the equity cost rate is a function of the dividend yield and
15 expected growth rate. Because I believe that investors are aware of the upward bias in
16 analysts’ long-term EPS growth-rate forecasts, stock prices reflect the bias. But the DCF
17 growth rate needs to be adjusted downward from the projected EPS growth rate to reflect
18 the upward bias in the DCF model.

1 **Q. PLEASE DISCUSS THE HISTORICAL GROWTH OF THE COMPANIES IN THE**
2 **PROXY GROUPS, AS PROVIDED BY *VALUE LINE*.**

3 A. Page 3 of Exhibit JRW-5 provides the 5-year and 10- year historical growth rates for EPS,
4 DPS, and BVPS for the companies in the two proxy groups, as published in the *Value Line*
5 *Investment Survey*. The median historical growth measures for EPS, DPS, and BVPS for
6 the Electric Proxy Group, as provided in Panel A, range from 4.00% to 5.00%, with an
7 average of the medians of 4.3%. For the Bulkley Proxy Group, as shown in Panel B of
8 page 3 of Exhibit JRW-5, the historical growth measures in EPS, DPS, and BVPS, as
9 measured by the medians, range from 3.80% to 5.00%, with an average of the medians of
10 4.3%.

11 **Q. PLEASE SUMMARIZE *VALUE LINE'S* PROJECTED GROWTH RATES FOR**
12 **THE COMPANIES IN THE PROXY GROUPS.**

13 A. *Value Line's* projections of EPS, DPS, and BVPS growth for the companies in the proxy
14 groups are shown on page 4 of Exhibit JRW-5. As stated above, due to the presence of
15 outliers, the medians are used in the analysis. For the Electric Proxy Group, as shown in
16 Panel A of page 4 of Exhibit JRW-5, the medians range from 4.00% to 6.00%, with an
17 average of the medians of 5.10%. The range of the medians for the Bulkley Proxy Group,
18 shown in Panel B of page 4 of Exhibit JRW-5, is from 5.00% to 6.00%, with an average of
19 the medians of 5.50%.

20 Also provided on page 4 of Exhibit JRW-5 are the prospective sustainable growth
21 rates for the companies in the two proxy groups as measured by *Value Line's* average
22 projected retention rate and return on shareholders' equity. As noted above, sustainable

1 growth is a significant and a primary driver of long-run earnings growth. For the Electric
2 Proxy Group and Bulkley Proxy Group, the median prospective sustainable growth rates
3 are 4.0 % and 4.0%, respectively.

4 **Q. PLEASE ASSESS GROWTH FOR THE PROXY GROUPS AS MEASURED BY**
5 **ANALYSTS' FORECASTS OF EXPECTED THREE-TO-FIVE YEAR EPS**
6 **GROWTH.**

7 A. Yahoo, Zacks, and S&P Cap IQ collect, summarize, and publish Wall Street analysts'
8 three-to-five-year EPS growth-rate forecasts for the companies in the proxy groups. These
9 forecasts are provided for the companies in the proxy groups on page 5 of Exhibit JRW-5.
10 I have reported both the mean and median growth rates for the groups. Since there is
11 considerable overlap in analyst coverage between the three services, and not all of the
12 companies have forecasts from the different services, I have averaged the expected five-year
13 EPS growth rates from the three services for each company to arrive at an expected EPS
14 growth rate for each company. The mean/median of analysts' projected EPS growth rates
15 for the Electric and Bulkley Proxy Groups are 5.6%/6.0% and 5.9%/6.2%, respectively.²³

16 **Q. PLEASE SUMMARIZE YOUR ANALYSIS OF THE HISTORICAL AND**
17 **PROSPECTIVE GROWTH OF THE PROXY GROUPS.**

18 A. Page 6 of Exhibit JRW-5 shows the summary of DCF growth rate indicators for the proxy
19 groups.

²³ Given variation in the measures of central tendency of analysts' projected EPS growth rates proxy groups, I have considered both the means and medians figures in the growth rate analysis.

1 The historical growth rate indicators for my Electric Proxy Group imply a baseline
2 growth rate of 4.3%. The average of the projected EPS, DPS, and BVPS growth rates from
3 *Value Line* is 5.1%, and *Value Line*'s projected sustainable growth rate is 4.0%.

4 The projected EPS growth rates of Wall Street analysts for the Electric Proxy Group
5 are 5.60% and 6.00% (average = 5.80%) as measured by the mean and median growth
6 rates. The overall range for the projected growth-rate indicators (ignoring historical
7 growth) is 4.0% to 5.8%, and the average of the three projected growth rates is 5.00%
8 (4.0%, 5.1%, 5.8%). Giving primary weight to the projected growth rates of Wall Street
9 analysts and *Value Line* but recognizing the upward bias nature of these forecasts, I believe
10 that the appropriate projected growth rate is within the range of 5.00% to 5.80%. I will use
11 the midpoint of this range, 5.40%, as my DCF growth rate for the Electric Proxy group.
12 This growth rate figure is in the upper end of the range of historic and projected growth
13 rates for the Electric Proxy Group.

14 For the Bulkley Proxy Group, the historical growth rate indicators suggest a growth
15 rate of 4.3%. The average of the projected EPS, DPS, and BVPS growth rates from *Value*
16 *Line* is 5.5%, and *Value Line*'s projected sustainable growth rate is 4.0%. The projected
17 EPS growth rates of Wall Street analysts are 5.9% and 6.2% (average = 6.1%) as measured
18 by the mean and median growth rates. The overall range for the projected growth-rate
19 indicators (ignoring historical growth) is 4.0% to 6.1% and the average of the three
20 projected growth rates is 5.20% (4.0%, 5.5%, 6.1%). Again, giving primary weight to the
21 projected growth rates of Wall Street analysts and *Value Line*, but recognizing the upward
22 bias nature of these forecasts, I believe that the appropriate projected growth rate is within

1 the range of 5.20% to 6.00%. I will use the midpoint of this range, 5.60%, as my DCF
2 growth rate for the Bulkley Proxy group. Similar to the Electric Proxy Group, this growth
3 rate figure is in the upper end of the range of historic and projected growth rates for the
4 Bulkley Proxy Group.

5 **Q. BASED ON THE ABOVE ANALYSIS, WHAT ARE YOUR INDICATED**
6 **COMMON EQUITY COST RATES FROM THE DCF MODEL FOR THE PROXY**
7 **GROUPS?**

8 A. My DCF-derived equity cost rates for the groups are summarized on page 1 of Exhibit
9 JRW-5 and in Table 7 below.

10 **Table 1**
DCF-Derived Equity Cost Rate/ROE

	Dividend Yield	1 + ½ Growth Adjustment	DCF Growth Rate	Equity Cost Rate
Electric Proxy Group	3.80%	1.0270	5.40%	9.30%
Bulkley Proxy Group	3.75%	1.0280	5.60%	9.45%

11 The result for the Electric Proxy Group is the 3.80% dividend yield, times the one
12 and one-half growth adjustment of 1.0270, plus the DCF growth rate of 5.40%, which
13 results in an equity cost rate of 9.30%. The result for the Bulkley Proxy Group is 9.45%,
14 which includes a dividend yield of 3.75%, an adjustment factor of 1.0280, and a DCF
15 growth rate of 5.60%.

C. Capital Asset Pricing Model

1 **Q. PLEASE DISCUSS THE CAPM.**

2 A. The CAPM is a risk premium approach to gauging a firm's cost of equity capital.
3 According to the risk premium approach, the cost of equity is the sum of the interest rate
4 on a risk-free bond (R_f) and a risk premium (RP), as in the following:

5
$$k = R_f + RP$$

6

7 The yield on long-term U.S. Treasury securities is normally used as R_f . Risk
8 premiums are measured in different ways. The CAPM is a theory of the risk and expected
9 returns of common stocks. In the CAPM, two types of risk are associated with a stock:
10 firm-specific risk or unsystematic risk, and market or systematic risk, which is measured
11 by a firm's beta. The only risk that investors receive a return for bearing is systematic risk.

12 According to the CAPM, the expected return on a company's stock, which is also
13 the equity cost rate (K), is equal to:

14
$$K = (R_f) + \beta \times [E(R_m) - (R_f)]$$

15 Where:

16 K represents the estimated rate of return on the stock;
17 $E(R_m)$ represents the expected return on the overall stock market. (Frequently, the
18 'market' refers to the S&P 500);
19 (R_f) represents the risk-free rate of interest;
20 $[E(R_m) - (R_f)]$ represents the expected equity or market risk premium—the excess
21 return that an investor expects to receive above the risk-free rate for investing in
22 risky stocks; and
23 $Beta$ —(β) is a measure of the systematic risk of an asset.

1 To estimate the required return or cost of equity using the CAPM requires three
2 inputs: the risk-free rate of interest (R_f), the beta (β), and the expected equity or market
3 risk premium [$E(R_m) - (R_f)$]. R_f is the easiest of the inputs to measure. It is represented by
4 the yield on long-term U.S. Treasury bonds. β , the measure of systematic risk, is a little
5 more difficult to measure because there are different opinions about what adjustments, if
6 any, should be made to historical betas due to their tendency to regress to 1.0 over time.
7 Finally, an even more difficult input to measure is the expected equity or market risk
8 premium ($E(R_m) - (R_f)$). I will discuss each of these inputs below.

9 **Q. PLEASE DISCUSS EXHIBIT JRW-6.**

10 A. Exhibit JRW-6 provides the summary results for my CAPM study. Page 1 shows the
11 results, and the following pages contain the supporting data.

12 **Q. PLEASE DISCUSS THE RISK-FREE INTEREST RATE.**

13 A. The yield on long-term U.S. Treasury bonds has usually been viewed as the risk-free rate
14 of interest in the CAPM. The yield on long-term U.S. Treasury bonds, in turn, has been
15 considered to be the yield on U.S. Treasury bonds with 30-year maturities.

16 **Q. WHAT RISK-FREE INTEREST RATE ARE YOU USING IN YOUR CAPM?**

17 A. As shown on page 2 of Exhibit JRW-6, the yield on 30-year U.S. Treasury bonds has been
18 in the 1.3% to 4.75% range over the 2010–2023 time period. The current 30-year Treasury
19 yield is above the average of this range. Kroll, a division of the investment firm Duff &
20 Phelps, recommends using a normalized risk-free interest rate.²⁴ Currently, Kroll is
21 recommending a normalized risk-free interest rate of 3.50%, or if the spot 20-year Treasury

²⁴ Kroll, *Cost of Capital Resource Center* (2023). <https://www.kroll.com/en/insights/publications/cost-of-capital/recommended-us-equity-risk-premium-and-corresponding-risk-free-rates>.

1 yield is above 3.50%, Kroll recommends using the spot 20-year Treasury yield. However,
2 they have also noted these yields are distorted currently.²⁵ “We are aware of lack of
3 liquidity issues in the U.S. Treasury market for the 20-year maturity, which is causing some
4 distortion in the 20-year yield relative to that observed for 10- and 30-year maturities.” The
5 illiquidity and resulting yield distortion has also been highlighted in the financial press.²⁶
6 As shown in Figure 5 (page 16), the yield curve is currently inverted with a yield “hump”
7 at the 20-year mark. The current 10-year, 20-year, and 30-year Treasury yields are in the
8 4.25%, 4.55%, and 4.30% range. Given the recent range of yields, and recognizing the
9 “hump,” I am using 4.30% as the risk-free rate, or R_f , in my CAPM.

10 **Q. DOES THE 4.30% RISK-FREE INTEREST RATE TAKE INTO**
11 **CONSIDERATION FORECASTS OF HIGHER INTEREST RATES?**

12 A. No, it does not. The 4.30% risk-free interest rate takes into account the range of interest
13 rates in the past, and effectively synchronizes the risk-free rate with the market risk
14 premium. The risk-free rate and the market risk premium are interrelated in that the market
15 risk premium is developed in relation to the risk-free rate. As discussed below, my market
16 risk premium is based on the results of many studies and surveys that have been published
17 over time.

18 **Q. PLEASE DISCUSS BETAS IN THE CAPM.**

19 A. Beta (β) is a measure of the systematic risk of a stock. The market, usually taken to be the
20 S&P 500, has a beta of 1.0. The beta of a stock with the same price movement as the

²⁵ Duff & Phelps, “Impact of High Inflation and Market Volatility on Cost of Capital Assumptions – October 2022 Update.” - //efaidnbmnnnibpcajpcglclefindmkaj/https://www.kroll.com/-/media/cost-of-capital/impact-high-inflation-market-volatility-coc-assumptions-2022.pdf.

²⁶ For example, see Duguid and Smith, “The market is just dead - Investors steer clear of 20-year Treasuries,” *Financial Times*, July 22, 2022.

1 market also has a beta of 1.0. A stock whose price movement is greater than that of the
2 market, such as a technology stock, is riskier than the market and has a beta greater than
3 1.0. A stock with below average price movement, such as that of a regulated public utility,
4 is less risky than the market and has a beta less than 1.0. Estimating a stock's beta involves
5 running a linear regression of a stock's return on the market return.

6 As shown on page 3 of Exhibit JRW-6, the slope of the regression line is the stock's
7 β . A steeper line indicates that the stock is more sensitive to the return on the overall
8 market. This means that the stock has a higher β and greater-than-average market risk. A
9 less steep line indicates a lower β and less market risk. Several online investment
10 information services, such as Yahoo and Reuters, provide estimates of stock betas. Usually
11 these services report different betas for the same stock. The differences are usually due to:
12 (1) the time period over which β is measured; and (2) any adjustments that are made to
13 reflect the fact that betas tend to regress to 1.0 over time.

14 **Q. PLEASE DISCUSS THE 2020 CHANGE IN BETAS.**

15 A. I have traditionally used the betas as provided in the *Value Line Investment Survey*. As
16 discussed above, the betas for utilities recently increased significantly as a result of the
17 volatility of utility stocks during the stock market meltdown associated with the novel
18 coronavirus in March 2020. Utility betas as measured by *Value Line* have been in the 0.55
19 to 0.70 range for the past 10 years. But utility stocks were much more volatile relative to
20 the market in March and April of 2020, and this resulted in an increase of above 0.30 to
21 the average utility beta.

1 *Value Line* defines their computation of beta as:²⁷

2 Beta - A relative measure of the historical sensitivity of a stock's price to
3 overall fluctuations in the New York Stock Exchange Composite Index. A
4 Beta of 1.50 indicates a stock tends to rise (or fall) 50% more than the New
5 York Stock Exchange Composite Index. The "Beta coefficient" is derived
6 from a regression analysis of the relationship between weekly percentage
7 changes in the price of a stock and weekly percentage changes in the NYSE
8 Index over a period of five years. In the case of shorter price histories, a
9 smaller time period is used, but two years is the minimum. The Betas are
10 adjusted for their long-term tendency to converge toward 1.00. *Value Line*
11 then adjusts these Betas to account for their long-term tendency to
12 converge toward 1.00.

13 However, there are several issues with *Value Line* betas:

- 14 1. *Value Line* betas are computed using weekly returns, and the volatility of utility
15 stocks during March 2020 was impacted by using weekly and not monthly returns.
16 Yahoo Finance uses five years of monthly returns to compute betas, and Yahoo
17 Finance's betas for utilities are lower than *Value Line*'s.
- 18 2. *Value Line* betas are computed using the New York Stock Exchange Index as the
19 market. While about 3,000 stocks trade on the NYSE, most technology stocks are
20 traded on the NASDAQ or over-the-counter market and not the NYSE. Technology
21 stocks, which make up about 25% of the S&P 500, tend to be more volatile. If they
22 were traded on the NYSE, they would increase the volatility of the measure of the
23 market and thereby lower utility betas.
- 24 3. Major vendors of CAPM betas such as Merrill Lynch, *Value Line*, and
25 Bloomberg publish adjusted betas. The so-called Blume adjustment cited by *Value*
26 *Line* adjusts betas calculated using historical returns data to reflect the tendency of

²⁷ <https://www.valueline.com/investment-education/glossary/b>.

1 stock betas to regress toward 1.0 over time, which means that the betas of typical
2 low beta stocks tend to increase toward 1.0, and the betas of typical high beta stocks
3 tend to decrease toward 1.0.²⁸

4 The Blume adjustment procedure is:

$$5 \quad \text{Regressed Beta} = .67 * (\text{Observed Beta}) + 0.33$$

6 For example, suppose a company has an observed past beta of 0.50. The regressed
7 (Blume-adjusted) beta would be:

$$8 \quad \text{Regressed Beta} = .67 * (0.50) + 0.33 = 0.67$$

9 Blume offered two reasons for betas to regress toward 1.0. First, he suggested it
10 may be a by-product of management's efforts to keep the level of a firm's systematic risk
11 close to that of the market. He also speculated that it results from management's efforts to
12 diversify through investment projects.

13 **Q. GIVEN THIS DISCUSSION, WHAT BETAS ARE YOU USING IN YOUR CAPM?**

14 A. As shown on page 3 of Exhibit JRW-6, the median *Value Line* betas for the two Proxy
15 Groups are 0.88 and 0.88. At present, I will continue to use *Value Line* betas in my CAPM,
16 which I believe is a conservative approach.

17 **Q. PLEASE DISCUSS THE MARKET RISK PREMIUM.**

18 A. The market risk premium is equal to the expected return on the stock market (e.g., the
19 expected return on the S&P 500, $E(R_m)$) minus the risk-free rate of interest (R_f). The market
20 risk premium is the difference in the expected total return between investing in equities
21 and investing in "safe" fixed-income assets, such as long-term government bonds.

²⁸ M. Blume, *On the Assessment of Risk*, J. OF FIN. (Mar. 1971).

1 However, while the market risk premium is easy to define conceptually, it is difficult to
2 measure because it requires an estimate of the expected return on the market— $E(R_m)$. As
3 I discuss below, there are different ways to measure $E(R_m)$, and studies have come up with
4 significantly different magnitudes for $E(R_m)$. As Merton Miller, the 1990 Nobel Prize
5 winner in economics, indicated, $E(R_m)$ is very difficult to measure and is one of the great
6 mysteries in finance.²⁹

7 **Q. PLEASE DISCUSS THE ALTERNATIVE APPROACHES TO ESTIMATING THE**
8 **MARKET RISK PREMIUM.**

9 A. Page 4 of Exhibit JRW-6 highlights the primary approaches to, and issues in, estimating
10 the expected market risk premium. The traditional way to measure the market risk premium
11 was to use the difference between historical average stock and bond returns. In this case,
12 historical stock and bond returns, also called *ex post* returns, were used as the measures of
13 the market's expected return (known as the *ex ante* or forward-looking expected return).
14 This type of historical evaluation of stock and bond returns is often called the “Ibbotson
15 approach” after Professor Roger Ibbotson, who popularized this method of using historical
16 financial market returns as measures of expected returns. However, this historical
17 evaluation of returns can be a problem because: (1) *ex post* returns are not the same as *ex*
18 *ante* expectations; (2) market risk premiums can change over time, increasing when
19 investors become more risk-averse and decreasing when investors become less risk-averse;
20 and (3) market conditions can change such that *ex post* historical returns are poor estimates
21 of *ex ante* expectations.

²⁹ Merton Miller, *The History of Finance: An Eyewitness Account*, J. APPLIED CORP. FIN., 3 (2000).

1 The use of historical returns as market expectations has been criticized in numerous
2 academic studies, which I discuss later. The general theme of these studies is that the large
3 equity risk premium discovered in historical stock and bond returns cannot be justified by
4 the fundamental data. These studies, which fall under the category “*ex ante* models and
5 market data,” compute *ex ante* expected returns using market data to arrive at an expected
6 equity risk premium. These studies have also been called “puzzle research” after the
7 famous study by Mehra and Prescott in which the authors first questioned the magnitude
8 of historical equity risk premiums relative to fundamentals.³⁰

9 In addition, there are a number of surveys of financial professionals regarding the
10 market risk premium, as well as several published surveys of academics on the equity risk
11 premium. Duke University has published a CFO Survey on a quarterly basis for over 10
12 years.³¹ Questions regarding expected stock and bond returns are also included in the
13 Federal Reserve Bank of Philadelphia’s annual survey of financial forecasters, which is
14 published as the *Survey of Professional Forecasters*.³² This survey of professional
15 economists has been published for almost 50 years. In addition, Pablo Fernandez conducts
16 annual surveys of financial analysts and companies regarding the equity risk premiums
17 used in their investment and financial decision making.³³

³⁰ Rajnish Mehra & Edward C. Prescott, *The Equity Premium: A Puzzle*, J. MONETARY ECON. 145 (1985).

³¹ *The CFO Survey*, DUKE UNIVERSITY, <https://www.richmondfed.org/cfosurvey>.

³² *Survey of Professional Forecasters*, FEDERAL RESERVE BANK OF PHILADELPHIA (Feb. 10, 2023), <https://www.philadelphiafed.org/-/media/frbp/assets/surveys-and-data/survey-of-professional-forecasters/2020/spfq120.pdf?la=en>. The Survey of Professional Forecasters was formerly conducted by the American Statistical Association (ASA) and the National Bureau of Economic Research (NBER) and was known as the ASA/NBER survey. The survey, which began in 1968, is conducted each quarter. The Federal Reserve Bank of Philadelphia, in cooperation with the NBER, assumed responsibility for the survey in June 1990.

³³ Pablo Fernandez, Teresa Garcia, and Pablo Acín, SURVEY: MARKET RISK PREMIUM AND RISK-FREE RATE USED FOR 80 COUNTRIES IN 2023, IESE BUSINESS SCHOOL WORKING PAPER (April 4, 2023).

1 **Q. PLEASE HIGHLIGHT THE RESULTS OF THE ACADEMIC AND**
2 **PROFESSIONAL STUDIES OF THE MARKET RISK PREMIUM.**

3 A. Derrig and Orr, Fernandez, and Song completed the most comprehensive reviews of the
4 research on the market risk premium.³⁴ Derrig and Orr's study evaluated the various
5 approaches to estimating market risk premiums, discussed the issues with the alternative
6 approaches, and summarized the findings of the published research on the market risk
7 premium. Fernandez examined four alternative measures of the market risk premium –
8 historical, expected, required, and implied. He also reviewed the major studies of the
9 market risk premium and presented the summary market risk premium results. Song
10 provided an annotated bibliography and highlighted the alternative approaches to
11 estimating the market risk premium.

12 Page 5 of Exhibit JRW-6 provides a summary of the results of the market risk
13 premium studies that I have reviewed. These include the results of: (1) the various studies
14 of the historical risk premium, (2) *ex ante* market risk premium studies, (3) market risk
15 premium surveys of CFOs, financial forecasters, analysts, companies, and academics, and
16 (4) the building blocks approach to the market risk premium. There are results reported
17 for over 30 studies, and the median market risk premium of these studies is 4.83%.

³⁴ See Richard Derrig & Elisha Orr, *Equity Risk Premium: Expectations Great and Small (Version 3.0)*, Aug. 28, 2003 (https://www.casact.org/sites/default/files/database/forum_04wforum_04wf001.pdf); Pablo Fernandez, EQUITY PREMIUM: HISTORICAL, EXPECTED, REQUIRED, AND IMPLIED, IESE BUSINESS SCHOOL WORKING PAPER (2007); ZHIYI SONG, THE EQUITY RISK PREMIUM: AN ANNOTATED BIBLIOGRAPHY (The CFA Institute Research (2007)).

1 **Q. PLEASE HIGHLIGHT THE RESULTS OF THE MORE RECENT RISK**
2 **PREMIUM STUDIES AND SURVEYS.**

3 A. The studies cited on page 5 of Exhibit JRW-6 include every market risk premium study
4 and survey I could identify that was published over the past 20 years and that provided a
5 market risk premium estimate. Many of these studies were published prior to the financial
6 crisis that began in 2008. In addition, some of these studies were published in the early
7 2000s at the market peak. It should be noted that many of these studies (as indicated) used
8 data over long periods of time (as long as 50 years of data) and so were not estimating a
9 market risk premium as of a specific point in time (e.g., the year 2001). To assess the effect
10 of the earlier studies on the market risk premium, I have reconstructed page 5 of Exhibit
11 JRW-6 on page 6 of Exhibit JRW-6; however, I have eliminated all studies dated before
12 January 2, 2010. The median market risk premium estimate for this subset of studies is
13 5.34%.

14 **Q. PLEASE SUMMARIZE THE MARKET RISK PREMIUM STUDIES AND**
15 **SURVEYS.**

16 A. The studies on page 6 of Exhibit JRW-6 can be summarized in the following manners:
17 **Historic Stock and Bond Returns:** Historic stock and bond returns suggest a market risk
18 premium in the 4.40% to 6.64% range, depending on whether one uses arithmetic or
19 geometric mean returns.
20 **Ex Ante Models:** Market risk-premium studies that use expected or *ex ante* return models
21 indicate a market risk premium in the range of 3.32% to 6.00%.

1 **Surveys:** Market risk premiums developed from surveys of analysts, companies, financial
2 professionals, and academics are lower, with a range from 3.15% to 5.70%.

3 **Building Block:** The mean reported market risk premiums reported in studies using the
4 building blocks approach range from 3.00% to 5.21%.

5 **Q. PLEASE HIGHLIGHT THE *EX ANTE* MARKET RISK PREMIUM STUDIES**
6 **AND SURVEYS THAT YOU BELIEVE ARE MOST TIMELY AND RELEVANT.**

7 A. I will highlight several studies/surveys.

8 Pablo Fernandez conducts annual surveys of financial analysts and companies
9 regarding the equity risk premiums used in their investment and financial decision-
10 making.³⁵ His survey results are included on pages 5 and 6 of Exhibit JRW-6. The results
11 of his 2023 survey of academics, financial analysts, and companies, which included 4,000
12 responses, indicated a mean market risk premium employed by U.S. analysts and
13 companies of 5.70%.³⁶ His estimated market risk premium for the U.S. has been in the
14 5.00% to 5.70% range in recent years.

15 Professor Aswath Damodaran of New York University, a leading expert on
16 valuation and the market risk premium, provides a monthly updated market risk premium
17 based on projected S&P 500 EPS and stock-price level and long-term interest rates. His
18 estimated market risk premium, shown graphically in Figure 12 below, has primarily been
19 in the range of 4.0% to 6.0% since 2010. As of August 1, 2023, his estimate of the implied
20 market risk premium was 4.38%.³⁷

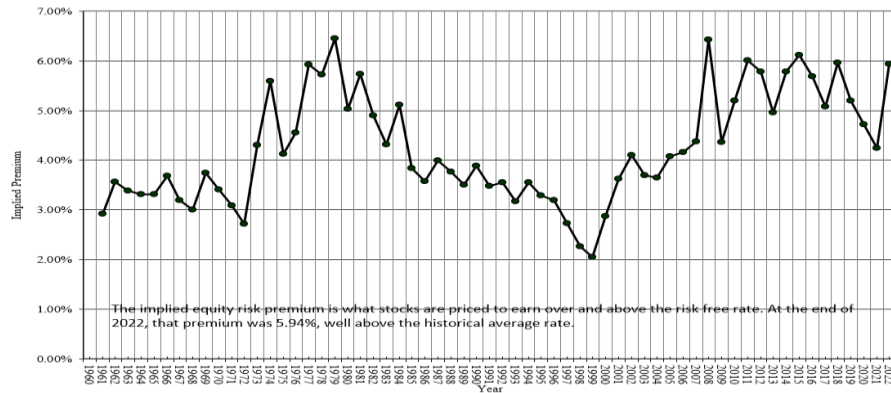

³⁵ Pablo Fernandez, Teresa Garcia, and Pablo Acín, SURVEY: MARKET RISK PREMIUM AND RISK-FREE RATE USED FOR 80 COUNTRIES IN 2023, IESE BUSINESS SCHOOL WORKING PAPER (March 2023).

Source: <http://pages.stern.nyu.edu/~adamodar/>.

2

As noted above, Kroll provides recommendations for the normalized risk-free interest rate and market risk premiums to be used in calculating the cost of capital data. Its recommendations over the 2008–2023 time periods are shown on page 7 of Exhibit JRW-6 and are shown graphically in Figure 13. Over the past decade, Kroll’s recommended normalized risk-free interest rates have been in the 2.50% to 4.50% range and market risk premiums have been in the 5.00% to 6.00% range. In early 2020, in the wake of the emergence of the novel coronavirus, Kroll decreased its recommended normalized risk-free interest rate from 3.0% to 2.50% and increased its market risk premium from 5.00% to 6.00%. Subsequently, on December 9, 2020, Kroll reduced its recommended market risk premium to 5.50%. But on October 18, 2022, Kroll once again increased its market risk premium to 6.00%. Most recently, on June 8, 2023, Kroll reduced its market risk premium to 5.50%.³⁸

13

Finally, KPMG, an international accounting firm, regularly publishes an update to its market risk premium to be used in its valuation practice. KPMG’s market risk premium is shown in Figure 14, which was as high as 6.75% in 2020, and was lowered to as low as

15

³⁸ <https://www.kroll.com/en/insights/publications/cost-of-capital/recommended-us-equity-risk-premium-and-corresponding-risk-free-rates>.

1 5.00% on September 30, 2021. KPMG increased its market risk premium to 6.0% on June
 2 30, 2022, but lowered it to 5.75% on December 31, 2022, to 5.50% on March 31, 2023,
 3 and to 5.25% on June 30, 2023.³⁹

5 **Figure 14**
KPMG Market Risk Premium Recommendations
2013–2023

<https://indialogue.io/clients/reports/public/5d9da61986db2894649a7ef2/5d9da63386db2894649a7ef5>.

6 **Q. GIVEN THESE RESULTS, WHAT MARKET RISK PREMIUM ARE YOU USING**
 7 **IN YOUR CAPM?**

³⁹ <https://indialogue.io/clients/reports/public/5d9da61986db2894649a7ef2/5d9da63386db2894649a7ef5>.

1 A. The studies on page 6 of Exhibit JRW-6 and, more importantly, the timelier and relevant
2 studies just cited suggest that the appropriate market risk premium in the U.S. is in the
3 4.0% to 6.0% range. I will use an expected market risk premium of 5.50%, which is the
4 upper end of the range. I gave most weight to the market risk-premium estimates of Kroll,
5 KPMG, the Fernandez survey, and Damodaran. This is a conservatively high estimate of
6 the market risk premium considering the many studies and surveys of the market risk
7 premium.

8 **Q. WHAT EQUITY COST RATE IS INDICATED BY YOUR CAPM ANALYSIS?**

9 A. The results of my CAPM study for the proxy group are summarized on page 1 of Exhibit
10 JRW-6 and in Table 8.

11 **Table 8**
CAPM-derived Equity Cost Rate/ROE
 $K = (R_f) + \beta * [E(R_m) - (R_f)]$

	Risk-Free Rate	Beta	Market Risk Premium	Equity Cost Rate
Electric Proxy Group	4.30%	0.88	5.50%	9.15%
Bulkley Proxy Group	4.30%	0.88	5.50%	9.15%

12 For both proxy groups, the risk-free rate of 4.30% plus the product of the beta of 0.88 times
13 the equity risk premium of 5.50% results in a 9.15% equity cost rate.

D. Equity Cost Rate Summary

1 **Q. PLEASE SUMMARIZE THE RESULTS OF YOUR EQUITY COST RATE**
2 **STUDIES.**

3 A. Table 9 provides my DCF and CAPM analyses for the proxy groups.

4 **Table 9**
ROEs Derived from DCF and CAPM Models

	DCF	CAPM
Electric Proxy Group	9.30%	9.15%
Bulkley Proxy Group	9.45%	9.15%

5 **Q. GIVEN THESE RESULTS, WHAT IS YOUR ESTIMATED EQUITY COST RATE**
6 **FOR THE GROUPS?**

7 A. Given these results, I conclude that the appropriate equity cost rate for companies in the
8 Electric and Bulkley Proxy Groups is in the 9.15% to 9.45% range. Since I rely primarily
9 on the DCF model and the results for the Electric Proxy Group and given that the
10 Companies' investment risk is below the average of the proxy groups, I am using a ROE
11 of 9.25% for the Companies.

12 **Q. PLEASE INDICATE WHY AN EQUITY COST RATE OF 9.25% IS**
13 **APPROPRIATE FOR THE COMPANIES.**

14 A. A number of reasons support an equity cost rate of 9.25% as appropriate and fair for the
15 Companies:

16 1. The Companies' proposed capital structures have more common equity and less
17 financial risk than the companies in the proxy groups. Hence, I have employed the
18 capital structures that the Companies received in their last rate case. In the

1 Companies' last two rate cases in 2018, which were settlements, EKM and EKC
2 agreed to capital structures with common equity ratios of 49.09% and 51.24%,
3 respectively. They have operated with these capitalizations since that time and have
4 maintained their credit ratings.

5 2. The investment risk of the Companies is below the average of the proxy groups.
6 The S&P and Moody's credit ratings of A- and Baa1 for EKC and A and Baa1 for
7 EKM are superior to the averages of the proxy groups, which are BBB+ and Baa2.

8 3. As Table 6 (page 36) shows, the electric utility industry is among the lowest risk
9 industries in the U.S. as measured by beta. As such, according to CAPM, the cost
10 of equity capital for this industry is among the lowest in the U.S.

11 4. On an annual basis, the average authorized ROEs for electric utility companies have
12 been 9.60% in 2018, 9.66% in 2019, 9.44% in 2020, 9.38% in 2021, 9.54% in 2022,
13 and 9.56% in the first half of 2023, according to Regulatory Research Associates.⁴⁰

14 As I discuss above, authorized ROEs have lagged behind capital market cost rates.
15 This observation is supported by the Werner and Jarvis (2022) study which
16 evaluated over 3,500 authorized ROEs over the past four decades and concluded
17 that authorized ROEs did not decline in line with capital costs and therefore past
18 authorized ROEs have overstated the actual cost of equity capital. Accordingly, I
19 believe my recommended ROE reflects the current capital market environment.

⁴⁰ S&P Global Market Intelligence, *RRA Regulatory Focus* (2023).

1 **Q. DOES YOUR 9.25% ROE RECOMMENDATION MEET THE *HOPE* AND**
2 ***BLUEFIELD* STANDARDS?**

3 A. Yes. As I previously noted, according to the *Hope* and *Bluefield* decisions, returns on
4 capital should be: (1) comparable to returns investors expect to earn on other investments
5 of similar risk; (2) sufficient to assure confidence in the company's financial integrity; and
6 (3) adequate to maintain and support the company's credit and to attract capital. As page 3
7 of Exhibit JRW-2 shows, electric utility companies have been earning in the 8.0% to 10.0%
8 range in recent years, they have investment-grade bond ratings, and their stocks sell well
9 above their book values. While my recommendation is below the average authorized ROEs
10 for electric utility companies, it reflects the downward trend in authorized and earned ROEs
11 of utilities.

VII. CRITIQUE OF THE COMPANIES' RATE OF RETURN TESTIMONY

12 **Q. PLEASE SUMMARIZE THE COMPANIES' COST OF CAPITAL**
13 **RECOMMENDATION.**

14 A. Mr. Andrews has proposed capital structures consisting of 48.00% long-term debt and
15 52.00% equity for EKM and 47.96% long-term debt and 52.04% equity for EKC. Mr.
16 Andrews has proposed long-term debt cost rates of 4.37% for EKM and 4.35% for EKC.
17 Ms. Bulkley proposes a ROE of 10.25% for the Companies. Based on these components,
18 Mr. Andrews has proposed an overall rate of return or cost of capital of 7.43% for EKM
19 and 7.42% for EKC. These recommendations are summarized on page 1 of Exhibit JRW-
20 7.

1 **Q. WHAT ARE THE AREAS OF DISAGREEMENT IN ESTIMATING THE RATE**
2 **OF RETURN OR COST OF CAPITAL IN THIS PROCEEDING?**

3 A. As I discuss above, the primary issues related to the Companies' rate of return include the
4 following: (1) capital market conditions; (2) the capital structure; (3) the Companies'
5 investment risk, (4) DCF Approach; (5) CAPM Approach; (6) the alternative risk premium
6 model; and (7) business and regulatory risks.

7 The capital market conditions, capital structure, and the Companies' investment
8 risk were previously discussed. I address the remaining items below.

9 **Q. PLEASE REVIEW MS. BULKLEY'S EQUITY COST RATE APPROACHES**
10 **AND RESULTS.**

11 A. Ms. Bulkley developed a proxy group of electric utilities and employed DCF, CAPM, and an
12 alternative risk premium model as her equity cost rate approaches. Ms. Bulkley's equity
13 cost rate estimates for the Companies are summarized on page 2 of Exhibit JRW-7. Based
14 on these figures, Ms. Bulkley concludes that the appropriate equity cost rate is 10.25% for
15 the Companies' electric utility operations.

A. DCF Approach

16 **Q. PLEASE SUMMARIZE MS. BULKLEY'S DCF ESTIMATES.**

17 A. On pages 36-42 of her testimony and in Exhibit AEB-3, Ms. Bulkley develops an equity cost
18 rate by applying the DCF model to her proxy group. Ms. Bulkley's DCF results are
19 summarized on page 2 of Exhibit JRW-7. In the traditional DCF approach, the equity cost
20 rate is the sum of the dividend yield and expected growth. Ms. Bulkley uses three dividend

1 yield measures (30, 90, and 180 days) in the DCF models conducted. In the constant-
2 growth DCF models, Ms. Bulkley has relied on the forecasted EPS growth rates of Zacks,
3 Yahoo Finance, and *Value Line*. Ms. Bulkley's mean and median DCF ROEs, using
4 average growth rates, range from 9.56% to 9.80%.

5 **Q. WHAT ARE THE ERRORS IN MS. BULKLEY'S DCF ANALYSES?**

6 A. The primary issues in Ms. Bulkley's DCF analyses are: (1) exclusively using the overly
7 optimistic and upwardly biased EPS growth rate forecasts of Wall Street analysts and *Value*
8 *Line*; and (2) claiming that the DCF results underestimate the market-determined cost of
9 equity capital due to high utility stock valuations and low dividend yields.

1. Analysts' EPS Growth Rate Forecasts

10 **Q. PLEASE DISCUSS MS. BULKLEY'S EXCLUSIVE RELIANCE ON THE**
11 **PROJECTED GROWTH RATES OF WALL STREET ANALYSTS AND *VALUE***
12 ***LINE*.**

13 A. Ms. Bulkley's exclusive reliance on the projected growth rates published by Wall Street
14 analysts and *Value Line* inflates her estimates of growth rates. It seems highly unlikely
15 that investors today would rely exclusively on the EPS growth-rate forecasts of Wall Street
16 analysts and *Value Line* and ignore other growth-rate measures in arriving at their expected
17 growth rates for equity investments.

18 As I previously stated, the appropriate growth rate in the DCF model is the dividend
19 growth rate rather than the earnings growth rate. Hence, consideration must be given to

1 other indicators of growth, including historical prospective dividend growth, internal
2 growth, as well as projected earnings growth.

3 In addition, I have provided evidence that analysts' EPS growth rate projections are
4 overly optimistic and upwardly biased. I have provided a discussion of this issue on pages
5 47-50 of this testimony and report on a study I conducted in Figure 11. Using the electric
6 utilities and gas distribution companies covered by *Value Line*, this study demonstrates that
7 the mean forecasted EPS growth rates are consistently greater than the achieved actual EPS
8 growth rates over the 1985-2022 time period. Over the entire period, the mean forecasted
9 EPS growth rate is over 200 basis points above the actual EPS growth rate. As such, the
10 projected EPS growth rates for utilities are overly optimistic and upwardly based. Hence,
11 exclusively using these growth rates as a DCF growth rate produces an overstated equity-
12 cost rate. In addition, I also highlighted a study by Szakmary, Conover, and Lancaster
13 (2008) who evaluated the accuracy of *Value Line's* three-to-five-year EPS growth rate
14 forecasts using companies in the Dow Jones Industrial Average over a thirty-year time
15 period and found these forecasted EPS growth rates to be significantly higher than the EPS
16 growth rates that these companies subsequently achieved.⁴¹

2. Claim that the DCF Model Understates the Cost of Equity Capital

17 **Q. PLEASE DISCUSS MS. BULKLEY'S CLAIM THAT THE DCF MODEL**
18 **UNDERSTATES THE COST OF EQUITY CAPITAL.**

19 **A.** On page 42 of her testimony, Ms. Bulkley claims that the DCF model in the current
20 environment underestimates the market-determined ROE using the DCF model.

⁴¹ Szakmary, A., Conover, C., & Lancaster, C., *An Examination of Value Line's Long-Term Projections*, J. BANKING & FIN., May 2008, at 820-33.

1 **Q. WHAT IS YOUR RESPONSE TO THIS CLAIM?**

2 A. Ms. Bulkley’s claim that utility stocks are overvalued and that their stock prices will
3 decline in the future (and therefore their dividend yield will increase) is without merit.
4 Hence, Ms. Bulkley presumes to know more than investors in the stock market. Actually,
5 if Ms. Bulkley believes that utility stock prices will decline in the future, the forecast should
6 be for negative returns, which is not what Ms. Bulkley presents here.

B. CAPM Approach

7 **Q. PLEASE DISCUSS MS. BULKLEY’S CAPM.**

8 A. On pages 42–48 of her testimony and in Exhibit Nos. AEB-4 - AEB-6, Ms. Bulkley develops
9 an equity cost rate by applying the CAPM model to her proxy group. Ms. Bulkley develops
10 an equity cost rate by using not only the traditional CAPM, but also the so-called Empirical
11 CAPM (“ECAPM”) model for her proxy group. Ms. Bulkley’s CAPM/ECAPM results are
12 summarized on page 2 of Exhibit JRW-7. The ECAPM is a variant of the traditional CAPM.
13 The CAPM/ECAPM approach requires an estimate of the risk-free interest rate, Beta, and
14 the equity risk premium. Ms. Bulkley uses: (1) current (3.81%), near-term projected
15 (3.78%), and long-term projected (3.90%) 30-year Treasury yields; (2) betas from *Value Line*
16 and Bloomberg; and (3) a market risk premium of 8.31%. Based on these figures, Ms.
17 Bulkley finds CAPM/ECAPM equity cost rates ranging from 9.96% to 11.32%.

1 **Q. WHAT ARE THE ERRORS IN MS. BULKLEY'S CAPM ANALYSIS?**

2 A. The primary errors with Ms. Bulkley's CAPM/ECAPM analyses are: (1) the use of the
3 ECAPM version of the CAPM and (2) the expected market risk premium of 8.31%.

1. The Validity of the ECAPM Approach

4 **Q. WHAT ISSUES DO YOU HAVE WITH MS. BULKLEY'S USE OF THE ECAPM?**

5 A. ECAPM, as popularized by rate of return consultant Dr. Roger Morin, attempts to model
6 the well-known finding of tests of the CAPM that have indicated the Security Market Line
7 (SML) is not as steep as predicted by CAPM. Accordingly, ECAPM is an alternative
8 version of the CAPM. However, the ECAPM has not been theoretically or empirically
9 validated in refereed journals. The ECAPM provides for weights that are used to adjust the
10 risk-free rate and market risk premium in applying ECAPM. Ms. Bulkley uses 0.25 and 0.75
11 factors to boost the equity risk premium measure but provides no empirical justification for
12 those figures.

13 Beyond the lack of any theoretical or empirical validation of ECAPM, there are two
14 errors in Ms. Bulkley's version of ECAPM: (1) I am not aware of any tests of the CAPM that
15 use adjusted betas such as those used by Ms. Bulkley; and (2) adjusted betas, which were
16 previously discussed already, address the empirical issues with CAPM. Specifically, the
17 beta adjustment (1) increases the beta and resulting expected return for low beta (beta<1.0)
18 stocks, and (2) decreases the beta and resulting expected return for high beta (beta>1.0)
19 stocks.

2. Overstated Market Risk Premium

1 **Q. PLEASE ASSESS MS. BULKLEY’S MARKET RISK PREMIUM DERIVED**
2 **FROM APPLYING THE DCF MODEL TO THE S&P 500 USING VALUE LINE**
3 **EPS GROWTH RATES.**

4 **A.** The most blatant error in Ms. Bulkley’s CAPM analysis is the magnitude of the market (or
5 equity) risk premium—which is then used to produce very high ROE results, as high as
6 11.32%. Ms. Bulkley develops an expected market risk premium by: (1) applying the DCF
7 model to the S&P 500 to get an expected market return; and (2) subtracting the risk-free rate
8 of interest. As shown in Table 10, Ms. Bulkley’s estimated market return of 12.11% for the
9 S&P 500 equals the sum of the dividend yield of 1.76% and expected EPS growth rate of
10 10.26%. The expected EPS growth rate is the average of the expected EPS growth rates
11 from S&P. The primary error in this approach is Ms. Bulkley’s expected DCF growth rate.
12 As previously discussed, the expected EPS growth rates of Wall Street analysts are
13 upwardly biased. In addition, as explained below, the projected growth rate is inconsistent
14 with actual economic and earnings growth rates in the U.S.

Table 10
Bulkley CAPM Market Risk Premium
S&P 500

Dividend Yield	1.76%
+ <u>Expected EPS Growth</u>	<u>10.26%</u>
= <u>Expected Market Return</u>	<u>12.11%</u>
+ <u>Risk-Free Rate</u>	<u>3.81%</u>
= <u>Market Risk Premium</u>	<u>8.31%</u>

1 **Q. PLEASE PROVIDE ADDITIONAL INSIGHTS INTO THE EXPECTED STOCK**
2 **MARKET RETURN OF 12.11%.**

3 A. Simply put, the assumption of a 12.11% expected stock market return is excessive and
4 unrealistic. According to Damodaran, the compounded annual return in the U.S. stock
5 market between 1928 and 2022 was about 10% (9.64%).⁴² Ms. Bulkley's CAPM results
6 assume that the return on the U.S. stock market will be about 20 percent higher in the future
7 than it has been in the past. The high expected stock market return, and the resulting market
8 risk premium and equity cost rate results are directly related to computing the expected
9 stock market return as the sum of the adjusted dividend yield plus the expected EPS growth
10 rate of 10.26%.

11 **Q. IS MS. BULKLEY'S EXPECTED STOCK MARKET RETURN OF 12.11%**
12 **REFLECTIVE OF THE STOCK MARKET RETURNS THAT INVESTMENT**
13 **FIRMS TELL INVESTORS TO EXPECT?**

14 A. No. Many investment firms provide investors with their estimates of the annual stock
15 returns that they should expect in the future. Most publish these expected returns in
16 documents entitled "Capital Market Assumptions" which are available at their websites. If
17 you google 'Capital Market Assumptions,' you get a long list of investment firms and their
18 base case expected annual return assumptions for stocks, bonds, and other financial assets.
19 In my search, I found thirty investment firms that published their capital market
20 assumptions. These are listed in Exhibit JRW-8, and include many of the largest, best-
21 known investment firms, including J.P. Morgan, BlackRock, BNY Mellon, Fidelity

⁴² Aswath Damodaran, *Damodaran Online*, N.Y. Univ., <http://pages.stern.nyu.edu/~adamodar/>.

1 Investments, Northern Trust, Vanguard Group, and State Street. Combined, these thirty
2 firms manage more than \$50 trillion in assets under management.

3 Figure 15 provides a histogram of the expected returns listed in Exhibit JRW-8.
4 The average duration of the long-term forecasts is 10 years. The range of the forecasted
5 U.S. annual large cap equity returns is 4.00% to 9.50%. The mean and standard deviation
6 of these expected returns are 6.87% and 1.28%.

7 **Figure 15**
Histogram of Investment Firm Expected Large Cap Equity Annual Returns
2023

Date Source: Exhibit JRW-8.

8 **Q. WHAT ARE YOUR OBSERVATIONS ON THE STOCK MARKET RETURNS**
9 **THAT INVESTMENT FIRMS TELL INVESTORS TO EXPECT?**

10 A. I have three comments: (1) These returns are below the historical average compounded
11 annual stock market return of 9.64% cited above (more on this below); (2) the standard
12 deviation of 1.28% is very low, which indicates that the expected returns provided by these
13 firms are quite similar, especially compared to historical stock market returns; and (3) these
14 expected returns indicate Ms. Bulkley's average expected stock market return of 12.11%
15 is almost double the average annual return investment firms tell investors they should
16 expect.

1 **Q. WHY DO YOU THINK THE STOCK MARKET RETURNS THAT INVESTMENT**
2 **FIRMS TELL INVESTORS TO EXPECT ARE LOWER THAN HISTORICAL**
3 **STOCK RETURNS?**

4 A. The biggest factor is that the valuation of the overall stock market is high relative to
5 historical standards. When stock prices are high, investors have to pay higher prices to buy
6 in, which lowers their future expected returns. Figure 16 provides Schiller's cyclically-
7 adjusted PE ratio (CAPE) over the last 100+ years.⁴³ Stocks prices have remained above
8 the mean historical CAPE level of 17.02% since 2009, with a current level of 28.80. Hence,
9 the higher valuation of the stock market leads to lower expected returns.

10

Figure 16
Schiller S&P 500 CAPE Ratio
2023

11
12
13

The Schiller S&P 500 CAPE ratio is based on average inflation-adjusted earnings from the previous 10 years. Data Source: <https://www.multpl.com/shiller-pe>.

14 **Q. HOW DO ISSUES WITH ANALYSTS' EPS GROWTH RATE FORECASTS**
15 **IMPACT MS. BULKLEY'S CAPM?**

16 A. The key point is that Ms. Bulkley's CAPM market risk premium methodology is based

⁴³ The S&P 500 Shiller CAPE Ratio is defined as the ratio the S&P 500's current price divided by the 10-year moving average of inflation-adjusted earnings. The metric was developed by economist Robert Shiller and is used to understand the valuation of the stock market. A higher (lower) CAPE ratio suggests lower (higher) returns in the future.

1 entirely on the concept that analyst projections of companies' three-to-five-year EPS
2 growth rates reflect investors' expected *long-term* EPS growth for those companies.
3 However, this assumption is highly unrealistic given the published research on these
4 projections. As previously noted, numerous studies have shown that the long-term EPS
5 growth rate forecasts of Wall Street securities analysts are overly optimistic and upwardly
6 biased.⁴⁴ Moreover, as I discuss above, the Lacina, Lee, and Xu study showed that analysts'
7 forecasts of EPS growth over the next three-to-five years are no more accurate than their
8 forecasts of the next single year's EPS growth (and the single year forecasts are notoriously
9 inaccurate). The overly optimistic inaccuracy of analysts' growth rate forecasts leads to an
10 upward bias in equity cost estimates estimated at about 300 basis points.⁴⁵

11 I have also completed studies on the accuracy of analysts' projected EPS growth
12 rates. In Figure 11 (page 49), I demonstrated that the EPS growth rate forecasts of Wall
13 Street analysts are upwardly biased for electric utilities and gas distribution companies. In
14 Figure 17, I provide the results of a study I performed using all companies followed by
15 I/B/E/S who have three-to-five-year EPS growth rate forecasts over the 1985–2022 time
16 period.

17 In this study, for each company with a three-to-five-year forecast, I compared the
18 average three-to-five-year average EPS growth rate forecasts to the actual EPS growth rates

⁴⁴ Such studies include: R.D. Harris, *The Accuracy, Bias, and Efficiency of Analysts' Long Run Earnings Growth Forecasts*, *J. of Business Fin. & Accounting*, 725–55 (June/July 1999); P. Dechow, A. Hutton, and R. Sloan, *The Relation Between Analysts' Forecasts of Long-Term Earnings Growth and Stock Price Performance Following Equity Offerings*, *Contemporary Accounting Research* (2000); K. Chan, L., Karceski, J., & Lakonishok, J., *The Level and Persistence of Growth Rates*, *J. of Fin.* 643–84 (2003); 8 Michael Lacina, B. Brian Lee, and Zhao Xu, *Advances in Business and Management Forecasting*, at 77–101 (Kenneth D. Lawrence, Ronald K. Klimberg, eds., Emerald Grp. Publ'g Ltd. 2011).

⁴⁵ Peter D. Easton & Gregory A. Sommers, *Effect of Analysts' Optimism on Estimates of the Expected Rate of Return Implied by Earnings Forecasts*, 45 *J. of Accounting Research*, 983–1015 (2007).

1 achieved over the three-to-five-year time period. In Figure 17, the mean of the projected
 2 EPS growth rates is the red line and the mean of the actual EPS growth rates is the blue
 3 line. Over the thirty-five years of the study, the mean projected three-to-five-year EPS
 4 growth rate was 12.50%, while the average actual achieved three-to-five-year EPS growth
 5 rate was 6.50%. This study demonstrates that the projected three-to-five-year EPS growth
 6 rate forecasts are upwardly biased and overly optimistic. As can be seen by comparing
 7 Figures 11 and 17, the degree of upward bias for all companies is much larger than it is for
 8 electric and gas utility companies.

Figure 17
Mean Forecasted vs. Actual Long-Term EPS Growth Rates

1985–2022

13
 14
 15 **Q. HAVE CHANGES IN REGULATIONS IMPACTING WALL STREET ANALYSTS**
 16 **AND THEIR RESEARCH IMPACTED THE UPWARD BIAS IN THEIR THREE-**
 17 **TO-FIVE YEAR EPS GROWTH-RATE FORECASTS?**

18 A. No. A number of the studies I have cited here demonstrate that the upward bias has
 19 continued, despite changes in regulations and reporting requirements over the past two
 20 decades. This observation is highlighted by a 2010 McKinsey study entitled “Equity

1 Analysts: Still Too Bullish,” which involved a study of the accuracy of analysts’ long-term,
2 EPS-growth-rate forecasts. The authors conclude that after a decade of stricter regulation,
3 analysts’ long-term earnings forecasts continue to be excessively optimistic. They made
4 the following observation:

5 Alas, a recently completed update of our work only reinforces this view—
6 despite a series of rules and regulations, dating to the last decade, that were
7 intended to improve the quality of the analysts’ long-term earnings
8 forecasts, restore investor confidence in them, and prevent conflicts of
9 interest. For executives, many of whom go to great lengths to satisfy Wall
10 Street’s expectations in their financial reporting and long-term strategic
11 moves, this is a cautionary tale worth remembering. This pattern confirms
12 our earlier findings that analysts typically lag behind events in revising their
13 forecasts to reflect new economic conditions. When economic growth
14 accelerates, the size of the forecast error declines; when economic growth
15 slows, it increases. So as economic growth cycles up and down, the actual
16 earnings S&P 500 companies report occasionally coincide with the
17 analysts’ forecasts, as they did, for example, in 1988, from 1994 to 1997,
18 and from 2003 to 2006. *Moreover, analysts have been persistently*
19 *overoptimistic for the past 25 years, with estimates ranging from 10 to 12*
20 *percent a year, compared with actual earnings growth of 6 percent. Over*
21 *this time frame, actual earnings growth surpassed forecasts in only two*
22 *instances, both during the earnings recovery following a recession. On*
23 *average, analysts’ forecasts have been almost 100 percent too high.*⁴⁶
24 *(Emphasis Added).*

25 This is the same observation made in a *Bloomberg Businessweek* article. The author
26 concluded:

27 ***The bottom line:** Despite reforms intended to improve Wall Street*
28 *research, stock analysts seem to be promoting an overly rosy view of*
29 *profit prospects.*⁴⁷

⁴⁶ Marc H. Goedhart, Rishi Raj, and Abhishek Saxena, “Equity Analysts, Still Too Bullish,” *McKinsey on Finance*, pp. 14-17, (Spring 2010) (emphasis added).

⁴⁷ Roben Farzad, “For Analysts, Things Are Always Looking Up,” *Bloomberg Businessweek* (June 10, 2010), <https://www.bloomberg.com/news/articles/2010-06-10/for-analysts-things-are-always-looking-up>.

1 **Q. IS MS. BULKLEY’S MARKET RISK PREMIUM OF 8.31% REFLECTIVE OF**
2 **THE MARKET RISK PREMIUMS FOUND IN PUBLISHED STUDIES AND**
3 **SURVEYS?**

4 A. No. This figure is well in excess of market risk premiums: (1) found in studies of the market
5 risk premium by leading academic scholars, (2) produced by analyses of historic stock and
6 bond returns, and (3) found in surveys of financial professionals. Page 6 of Exhibit JRW-
7 6 provides the results of over 30 market risk premium studies from the past 15 years.⁴⁸
8 Historic stock and bond returns suggest a market risk premium in the 4.40%–6.64% range,
9 depending on whether one uses arithmetic or geometric mean returns. There have been
10 many studies using expected return (also called *ex ante*) models, and their market risk
11 premiums results vary from as low as 3.32% to as high as 6.0%. Finally, the market risk
12 premiums developed from surveys of analysts, companies, financial professionals, and
13 academics suggest even potentially lower market risk premiums, in a range from 3.15% to
14 5.70%. The bottom line is that there is no support in historic return data, surveys, academic
15 studies, or reports for investment firms for a market risk premium as high as the 8.31%
16 used by Ms. Bulkley.

17 **Q. IS THERE OTHER EVIDENCE THAT INDICATES THAT MS. BULKLEY’S**
18 **MARKET RISK PREMIUM IS EXCESSIVE?**

19 A. Yes. A long-term EPS growth rate of 10.26% is inconsistent with both historic and
20 projected economic and earnings growth in the U.S. for several reasons: (1) long-term EPS
21 and economic growth is about one-half of Ms. Bulkley’s projected EPS growth rate of

⁴⁸ See Woolridge, Exh. JRW-6 at 6.

1 long-term EPS and GDP growth rates. Brad Cornell of the California Institute of
2 Technology published a study on GDP growth, earnings growth, and equity returns. Mr.
3 Cornell finds that long-term EPS growth in the U.S. is directly related to GDP growth, with
4 GDP growth providing an upward limit on EPS growth. In addition, the study finds that
5 long-term stock returns are determined by long-term earnings growth. Cornell concludes
6 with the following observations:⁵⁰

7 The long-run performance of equity investments is fundamentally linked to
8 growth in earnings. Earnings growth, in turn, depends on growth in real
9 GDP. This article demonstrates that both theoretical research and empirical
10 research in development economics suggest relatively strict limits on future
11 growth. In particular, real GDP growth in excess of 3 percent in the long
12 run is highly unlikely in the developed world. In light of ongoing dilution
13 in earnings per share, this finding implies that investors should anticipate
14 real returns on U.S. common stocks to average no more than about 4–5
15 percent in real terms.

16 Annual Growth rates in nominal GDP are shown on page 2 of Exhibit JRW-9.
17 Nominal GDP growth was in the four percent range over the past decade until the COVID-
18 19 Pandemic hit in 2020. Nominal GDP fell by 2.2% in 2020, before rebounding and
19 growing by over 10.0% in 2021 and in 2022. The components of nominal GDP growth are
20 real GDP growth and inflation. Page 3 of Exhibit JRW-9 shows the annual real GDP
21 growth rate between 1961 and 2022. Real GDP growth has gradually declined from the 5.0
22 percent to 6.0 percent range in the 1960s to the 2.0% to 3.0% range during the 2015–2019
23 period. Real GDP fell by 3.5% in 2020, but rebounded and grew by 5.7% in 2021 and 2.1%
24 in 2022.

25 The second component of nominal GDP growth is inflation. Page 4 of Exhibit JRW-

⁵⁰ Bradford Cornell, *Economic Growth and Equity Investing*, Fin. Analysts J. at 63 (Jan.-Feb. 2010).

1 9 shows inflation as measured by the annual growth rate in the Consumer Price Index
2 (“CPI”) from 1961 to 2022. The large increase in prices from the late 1960s to the early
3 1980s is readily evident. Equally evident is the rapid decline in inflation during the 1980s
4 as inflation declined from above ten percent to about four percent. Since that time, inflation
5 has gradually declined and was in the 2.0% range or below from 2015 to 2020. Prices
6 increased in 2021 and 2022 with the rebounding economy and increased by 4.7% in 2021
7 and 8.0% in 2022. Year-over-year inflation in 2022 jumped to 40-year highs in 2022 due
8 to supply chain issues and the Russia-Ukraine conflict, but longer-term inflation is
9 expected to be in the 2.0%–3.0% range.

10 The graphs on pages 2, 3, and 4 of Exhibit JRW-9 provide clear evidence of the
11 decline, in recent decades, in nominal GDP as well as its components, real GDP, and
12 inflation. To gauge the magnitude of the decline in nominal GDP growth, Table 12
13 provides the compounded GDP growth rates for 10-, 20-, 30-, 40- and 50- years. Whereas
14 the 50-year compounded GDP growth rate is 6.16%, there has been a near monotonic and
15 significant decline in nominal GDP growth over subsequent 10-year intervals. These figures
16 strongly suggest that nominal GDP growth in recent decades has slowed and that a figure in
17 the range of 4.0% to 5.0% is more appropriate today for the U.S. economy.

18 **Table 12**
19 **Historical Nominal GDP Growth Rates**

10-Year Average	4.59%
20-Year Average	4.32%
30-Year Average	4.65%
40-Year Average	5.21%
50-Year Average	6.16%

1 **Long-Term GDP Projections Also Indicate Slower GDP Growth in the Future:** A

2 lower range is also consistent with long-term GDP forecasts. There are several forecasts of
3 annual GDP growth that are available from economists and government agencies. These
4 are listed in Panel B of page 5 of Exhibit JRW-9.

5 The mean 10-year nominal GDP growth forecast (as of February 2023) by
6 economists in the recent *Survey of Financial Forecasters* is 4.40%.⁵¹ The Energy
7 Information Administration (EIA), in its projections used in preparing *Annual Energy*
8 *Outlook*, forecasts long-term GDP growth of 4.3% for the period 2023 to 2053.⁵² The
9 Congressional Budget Office (CBO), in its forecasts for the period 2023 to 2053, projects
10 a nominal GDP growth rate of 3.8%.⁵³ Finally, the Social Security Administration (SSA)
11 provides a projection of nominal GDP growth of 4.1% for the period of 2023 to 2100.⁵⁴
12 The average projected GDP growth rate for these four forecasts is 4.15%.

13 The bottom line is that the trends and projections suggest a long-term GDP growth
14 rate in the 4.0% to 4.5% range. As such, Ms. Bulkley's average projected EPS growth rate
15 of 10.26% is more than double the projected GDP growth.

⁵¹ Ten-year median projected real GDP growth of 2.00% and CPI inflation of 2.37%. *Survey of Professional Forecasters*, Fed. Reserve Bank of Philadelphia, <https://www.philadelphiafed.org/research-and-data/real-time-center/survey-of-professional-forecasters/>.

⁵² *Annual Energy Outlook 2023*, U.S. ENERGY INFORMATION ADMINISTRATION, Table: Macroeconomic Indicators.

⁵³ *The 2023 Long-Term Budget Outlook*, CONGRESSIONAL BUDGET OFFICE, July 15, 2023.

⁵⁴ Social Security Administration, *2023 Annual Report of the Board of Trustees of the Old-Age, Survivors, and Disability Insurance (OASDI) Program*, Table VI.G4, (July 1, 2023). The 4.1% growth rate is the growth in projected GDP from 2023 to 2100.

1 **Q. WHAT FUNDAMENTAL FACTORS HAVE LED TO THE DECLINE IN**
2 **PROSPECTIVE GDP GROWTH?**

3 A. As addressed in a study by the consulting firm McKinsey & Co., two factors drive real
4 GDP growth over time: (a) the number of workers in the economy (employment); and (2)
5 the productivity of those workers (usually defined as output per hour).⁵⁵ According to
6 McKinsey, population and productivity growth drove real GDP growth over the past 50
7 years, at compound annual rates of 1.7% and 1.8%, respectively.

8 However, global economic growth is projected to slow significantly in the years to
9 come. The primary factor leading to the decline is slow growth in employment (working-
10 age population), which results from slower population growth and longer life expectancy.
11 McKinsey estimates that employment growth will slow to 0.3% over the next 50 years.
12 They conclude that even if productivity remains at the rapid rate of the past 50 years of
13 1.8%, real GDP growth will fall by 40% to 2.1%.

14 **Q. OVER THE MEDIUM TO LONG RUN, IS S&P 500 EPS GROWTH LIKELY TO**
15 **OUTPACE GDP GROWTH?**

16 A. No. Figure 18 shows the average annual growth rates for GDP and the S&P 500 EPS since
17 1960. The one very apparent difference between the two is that the S&P 500 EPS growth
18 rates are much more volatile than the GDP growth rates, when compared using the
19 relatively short, and somewhat arbitrary, annual conventions used in these data.⁵⁶

⁵⁵ James Manyika, et al., *Can Long-Term Growth be Saved?*, McKinsey Global Institute. (Jan. 1, 2015), <https://www.mckinsey.com/featured-insights/employment-and-growth/can-long-term-global-growth-be-saved>.

⁵⁶ Timing conventions such as years and quarters are needed for measurement and benchmarking but are somewhat arbitrary. In reality, economic growth and profit accrual occur on continuous bases. A 2014 study evaluated the timing relationship between corporate profits and nominal GDP growth. The authors found that aggregate accounting earnings growth is a leading indicator of the GDP growth with a quarter-ahead forecast horizon. *See*

1 Volatility aside, it is clear that over the medium to long run, S&P 500 EPS growth does not
2 significantly outpace GDP growth.

3 **Figure 18**

9
10 A fuller understanding of the relationship between GDP and S&P 500 EPS growth
11 requires consideration of at least three factors, as follows.

12 **Corporate Profits are Constrained by GDP:** In a *Fortune* magazine article, Milton
13 Friedman, the winner of the 1976 Nobel Prize in Economic Sciences, warned investors and
14 others not to expect corporate-profit growth to sustainably exceed GDP growth, stating,
15 “Beware of predictions that earnings can grow faster than the economy for long periods.
16 When earnings are exceptionally high, they don’t just keep booming.”⁵⁷ In that same
17 article, Friedman also noted that profits must move back down to their traditional share of
18 GDP. In Table 13, I show that the aggregate net income levels for the S&P 500 companies,
19 using 2022 figures, represent 6.11% of nominal GDP.

Yaniv Konchitchki and Panos N. Patatoukas, *Accounting Earnings and Gross Domestic Product*, 57 *J. of Accounting and Economics* 76–88 (2014).

⁵⁷ Shaun Tully, *Corporate Profits Are Soaring. Here’s Why It Can’t Last*, *Fortune*, Dec. 7, 2017, <http://fortune.com/2017/12/07/corporate-earnings-profit-boom-end/>.

Table 13
S&P 500 Aggregate Net Income as a Percent of GDP

2022	
Value (\$B)	
Aggregate Net Income for S&P 500	\$1,555.98
2021 Nominal U.S. GDP	25,461.34
Net Income/GDP (%)	6.11%

Data Sources: 2022 Net Income for S&P 500 companies
https://www.gurufocus.com/economic_indicators/5749/sp-500-net-income-ttm.
2022 Nominal GDP – <https://pages.stern.nyu.edu/~adamodar/>.

Short-Term Factors Impact S&P 500 EPS: The growth rates in the S&P 500 EPS and GDP can diverge on a year-to-year basis due to short-term factors that impact S&P 500 EPS in a much greater way than GDP. As shown above, S&P EPS growth rates are much more volatile than GDP growth rates. The EPS growth for the S&P 500 companies has been influenced by low labor costs and interest rates, commodity prices, the recovery of different sectors such as the energy and financial sectors, and the cut in corporate tax rates. These short-term factors can make it appear that there is a disconnect between the economy and corporate profits.

The Differences between the S&P 500 EPS and GDP: In the last two years, as the EPS for the S&P 500 has grown at a faster rate than U.S. nominal GDP, some have pointed to the differences between the S&P 500 and GDP.⁵⁸ These differences include: (a) corporate profits are about 2/3 manufacturing driven, while GDP is 2/3 services driven; (b) consumer discretionary spending accounts for a smaller share of S&P 500 profits (15%) than of GDP (23%); (c) corporate profits are more international-trade driven, while exports minus

⁵⁸ See the following studies: Burt White and Jeff Buchbinder, *The S&P and GDP are not the Same Thing*, LPL Fin. (Nov. 4, 2014, 11:31 AM), <https://www.businessinsider.com/sp-is-not-gdp-2014-11>; Matt Comer, *How Do We Have 18.4% Earnings Growth In A 2.58% GDP Economy?*, Seeking Alpha (Apr. 19, 2018, 1:04 PM), https://seekingalpha.com/article/4164052-18_4-percent-earnings-growth-2_58-percent-gdp-economy; Shaun Tully, *How on Earth Can Profits Grow at 10% in a 2% Economy?*, Fortune, (July 27, 2017, 1:26 PM), <http://fortune.com/2017/07/27/profits-economic-growth/>.

1 imports tend to drag on GDP; and (d) S&P 500 EPS is affected not just by corporate profits
2 but also by share buybacks on the positive side (fewer shares boost EPS), and by share
3 dilution on the negative side (new shares dilute EPS). While these differences may seem
4 significant, it must be remembered that the Income Approach to measure GDP includes
5 corporate profits (in addition to employee compensation and taxes on production and
6 imports) and therefore effectively accounts for the first three factors.⁵⁹

7 The bottom line is that despite the intertemporal short-term differences between
8 S&P 500 EPS and nominal GDP growth, the long-term link between corporate profits
9 and GDP is inevitable.

10 **Q. PLEASE PROVIDE ADDITIONAL EVIDENCE SHOWING THAT MS.**
11 **BULKLEY’S S&P 500 EPS GROWTH RATE OF 10.26% IS NOT REALISTIC.**

12 A. Beyond my previous discussion, I have performed the following analysis of S&P 500 EPS
13 and GDP growth in Table 14. Specifically, I started with the 2022 aggregate net income
14 for the S&P 500 companies and 2022 nominal GDP for the U.S. As shown in Table 13, the
15 aggregate profit for the S&P 500 companies represented 6.11% of nominal GDP in 2022.
16 In Table 14, I then projected the aggregate net income level for the S&P 500 companies
17 and GDP, as of the year 2050. For the growth rate for the S&P 500 companies, I used Ms.
18 Bulkley’s average projected S&P 500 EPS growth rate of 10.26%. As a growth rate for
19 nominal GDP, I used the average of the long-term projected GDP growth rates from CBO,
20 SFF, SSA, and EIA (3.8%, 4.4%, 4.1%, and 4.3%, respectively), which is 4.15%. The
21 projected 2050 level for the aggregate net income level for the S&P 500 companies is

⁵⁹ The Income Approach to measuring GDP includes wages, salaries, and supplementary labor income, corporate profits, interest and miscellaneous investment income, farmers’ incomes, and income from non-farm unincorporated businesses.

1 \$23.97 trillion. Over the same period, GDP is expected to grow to \$79.50 trillion. As such,
 2 if the aggregate net income for the S&P 500 grows in accordance with the growth rate used
 3 by Ms. Bulkley (10.26%), and if nominal GDP grows at rates projected by major
 4 government agencies (4.15%), the net income of the S&P 500 companies will represent
 5 growth from 6.11% of GDP in 2022 to 30.16% of GDP in 2050. It is totally unrealistic for
 6 the net income of the S&P 500 to become such a large component of GDP.

Table 14
Projected S&P 500 Earnings and Nominal GDP
2022-2050
S&P 500 Aggregate Net Income as a Percent of GDP

	2022 Value (\$B)	Growth Rate	No. of Years	2050 Value (\$B)
Aggregate Net Income for S&P 500	\$1,555.98	10.26%	28	\$ 23,972.20
2022 Nominal U.S. GDP	\$25,461.34	4.15%	28	\$ 79,495.21
Net Income/GDP (%)	6.11%			30.16%

Data Sources: 2022 Net Income for S&P 500 companies
https://www.gurufocus.com/economic_indicators/5749/sp-500-net-income-ttm.
 Growth Rate - Bulkley's average projected S&P 500 EPS growth rate of 10.26%.
 Nominal GDP Growth Rate – The average of the long-term projected GDP growth rates from CBO, SFF, SSA,
 and EIA (3.8%, 4.4%, 4.1%, and 4.3% = 4.15%).

11 **Q. PLEASE PROVIDE A SUMMARY ASSESSMENT OF GDP AND S&P 500 EPS**
 12 **GROWTH RATES.**

13 A. The long-term link between corporate profits and GDP is inevitable. The short-term
 14 differences in growth between the two indicate that corporate profits as a share of GDP
 15 tend to go far higher after periods where they are depressed, and then drop sharply after
 16 they have been hovering at historically high levels. In a famous 1999 *Fortune* article,
 17 Warren Buffet made the following observation:⁶⁰

⁶⁰ Carol Loomis, *Mr. Buffet on the Stock Market*, *Fortune* (Nov. 22, 1999),
https://money.cnn.com/magazines/fortune/fortune_archive/1999/11/22/269071/.

1 You know, someone once told me that New York has more lawyers than
2 people. I think that's the same fellow who thinks profits will become larger
3 than GDP. When you begin to expect the growth of a component factor to
4 forever outpace that of the aggregate, you get into certain mathematical
5 problems. In my opinion, you have to be wildly optimistic to believe that
6 corporate profits as a percent of GDP can, for any sustained period, hold
7 much above 6%.

8
9 In sum, Ms. Bulkley's average long-term S&P 500 EPS growth rate of 10.26% is
10 highly overstated and has little (if any) basis in economic reality. In the end, the question
11 remains whether corporate profits can grow faster than GDP. Jeremy Siegel, the renowned
12 finance professor at the Wharton School of the University of Pennsylvania, believes that
13 going forward, earnings per share can grow about half a point faster than nominal GDP, or
14 about five percent, due to the big gains in the technology sector. But Siegel also believes
15 that sustained EPS growth matching analysts' near-term projections is absurd: "The idea
16 of 8% or 10% or 12% growth is ridiculous. It will not happen."⁶¹

C. Alternative Risk Premium Approach

17 **Q. PLEASE REVIEW MS. BULKLEY'S ALTERNATIVE RISK PREMIUM MODEL.**

18 **A.** On pages 48–51 of her testimony and in Exhibit No. AEB-7, Ms. Bulkley estimates an equity
19 cost rate using a risk premium model. Using the quarterly authorized ROEs for electric utility
20 and gas distribution companies from Q1 1992 until Q1 2023, Ms. Bulkley develops an equity
21 cost rate by regressing the authorized returns on equity for electric utility companies on the
22 30-year Treasury Yield. She then adds the risk premium established by regressing the
23 authorized returns on equity to each of her three different 30-year Treasury yields: (a) a current

⁶¹ Shaun Tully, *Corporate Profits Are Soaring. Here's Why It Can't Last*, *Fortune* (Dec. 7, 2017, 3:30 AM), <http://fortune.com/2017/12/07/corporate-earnings-profit-boom-end/>.

1 yield of 3.81%, (b) a near-term projected yield of 3.78%, and (c) a long-term projected yield
2 of 3.90%. Ms. Bulkley's risk premium results are provided in page 2 of Exhibit JRW-7.
3 Ms. Bulkley reports risk premium equity cost rates ranging from 10.26% to 10.32%.

4 **Q. WHAT ARE THE ERRORS IN MS. BULKLEY'S BOND YIELD PLUS RISK**
5 **PREMIUM ("BYRP") ANALYSIS?**

6 A. There are several problems with this approach for calculating the risk premium.

7 First, the methodology produces an inflated measure of the risk premium because it
8 uses historic authorized ROEs and Treasury yields, and the resulting risk premium is applied
9 to projected Treasury yields. Since Treasury yields are always forecasted to increase, the
10 resulting risk premium would be smaller if done correctly, which would be the result using
11 projected Treasury yields in the analysis rather than historic Treasury yields.

12 Second, Ms. Bulkley's risk premium approach is a gauge of *regulator* behavior and
13 not *investor* behavior. Capital costs are determined in the marketplace through the financial
14 decisions of investors and are reflected in such fundamental factors as dividend yields,
15 expected growth rates, interest rates, and investors' assessment of the risk and expected
16 return of different investments. Regulatory commissions evaluate capital market data in
17 setting authorized ROEs, but also consider other utility- and rate case-specific information
18 in setting ROEs. As such, Ms. Bulkley's approach and results reflect other factors such as
19 capital structure, credit ratings and other risk measures, service territory, capital
20 expenditures, energy supply issues, rate design, investment and expense trackers, and other
21 factors used by utility commissions in determining an appropriate ROE in addition to
22 capital costs. This may especially be true when the authorized ROE data includes the results

1 of rate cases that are settled and not fully litigated.

2 Third, since the stocks of electric utilities have been selling above book value for
3 the last decade, it is obvious that the authorized ROEs of state utility commissions are
4 above the returns that investors require.

5 Fourth, the ROE derived from this approach is dependent on the authorized ROEs
6 from state utility commissions. As discussed earlier in this testimony, Werner and Jarvis
7 (2022), demonstrated that authorized ROEs over the past four decades have not declined
8 in line with capital costs and therefore past authorized ROEs have overstated the actual
9 cost of equity capital.

10 **Q. HOW DO MS. BULKLEY'S RISK PREMIUM RESULTS COMPARE TO THE**
11 **CURRENT AUTHORIZED ROES FOR ELECTRIC UTILITIES?**

12 A. Ms. Bulkley reports ROE results as high as 10.32% from her risk premium model, which
13 is based on authorized ROEs. By comparison, the average authorized ROE for electric utility
14 companies in 2022 was 9.54% and 9.66% in the first half of 2023.

D. Business and Regulatory Risks

15 **Q. PLEASE DISCUSS THE OTHER FACTORS CONSIDERED BY MS. BULKLEY**
16 **IN ARRIVING AT HER 10.25% ROE RECOMMENDATION.**

17 A. Ms. Bulkley also considers several elements of the Companies' regulatory and business
18 risks in arriving at her 10.25% ROE recommendation. These include: the Companies'
19 capital expenditures and elements of the Companies' regulatory risk in Kansas. However,
20 these two factors are risk considerations utilized in the credit rating process. The S&P and

1 Moody's credit ratings of A- and Baa1 for EKC and A and Baa1 for EKM are superior to
2 the averages of the proxy groups. These issuer credit ratings indicate that the Companies'
3 investment risk is below the average of the two proxy groups, who have average S&P and
4 Moody's issuer credit ratings of BBB+ and Baa2. As a result, despite these two factors,
5 the Companies' investment risk is still below the average of the proxy groups.
6

VIII. SUMMARY AND CONCLUSIONS

7
8 **Q. PLEASE SUMMARIZE YOUR TESTIMONY ON THE APPROPRIATE COST OF**
9 **CAPITAL FOR THE COMPANIES.**

10 A. The Companies' proposed capital structures include much higher common equity ratios
11 than the averages of the two proxy groups. Furthermore, the S&P and Moody's credit
12 ratings of A- and Baa1 for EKC and of A and Baa1 for EKM are superior to the averages
13 of the proxy groups. The Companies received these credit ratings after the merger
14 agreement was finalized and the Companies received their own separate capitalizations. In
15 the Companies' most recently settled rate cases in 2018, EKM and EKC agreed to capital
16 structures with Common equity ratios of 49.09% and 51.24%, respectively. They have
17 operated with these capitalizations since that time and have maintained their credit ratings.
18 Hence, I am employing the capital structures adopted in the Companies' last rate cases. I
19 have adopted the Companies' proposed long-term debt cost rates. I have applied the DCF
20 Model and the CAPM to my proxy group of publicly-held electric utility companies as well
21 as the group developed by Ms. Bulkley. My analysis indicates a common equity cost rate

1 in the range of 9.15% to 9.45% is appropriate. Since I rely primarily on the DCF model
2 and the results for the Electric Proxy Group, and in light of the lower investment risk level
3 of the Companies relative to the proxy groups, I am using a ROE of 9.25% for the
4 Companies. Given my proposed capital structure and capital cost rates for the Companies,
5 I am recommending an overall fair rate of return or cost of capital of 6.77% for EKM and
6 6.86% for EKC. These are summarized in Table 2 and Exhibit JRW-1.

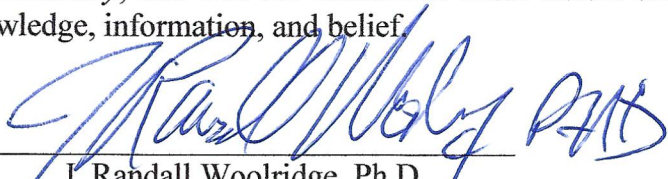

7 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

8 A. Yes.

VERIFICATION

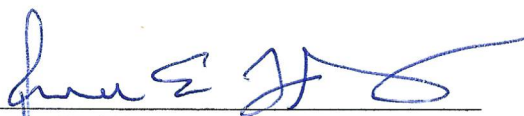

COMMONWEALTH OF PENNSYLVANIA)
)
COUNTY OF CENTRE) ss:

Dr. J. Randall Woolridge, being duly sworn upon his oath, deposes and states that he is a consultant for the Citizens' Utility Ratepayer Board, that he has read and is familiar with the foregoing *Direct Testimony*, and that the statements made herein are true and correct to the best of his knowledge, information, and belief.

J. Randall Woolridge, Ph.D.

SUBSCRIBED AND SWORN to before me this 25th day of August, 2023.

Notary Public

My Commission expires:
11-10-2023

Appendix A

Educational Background, Research, and Related Business Experience J. Randall Woolridge

J. Randall Woolridge is a Professor of Finance and the Goldman, Sachs & Co. and Frank P. Smeal Endowed Faculty Fellow in Business Administration in the College of Business Administration of the Pennsylvania State University in University Park, PA. In addition, Professor Woolridge is Director of the Smeal College Trading Room and President and CEO of the Nittany Lion Fund, LLC.

Professor Woolridge received a Bachelor of Arts degree in Economics from the University of North Carolina, a Master of Business Administration degree from the Pennsylvania State University, and a Doctor of Philosophy degree in Business Administration (major area-finance, minor area-statistics) from the University of Iowa. He has taught Finance courses including corporation finance, commercial and investment banking, and investments at the undergraduate, graduate, and executive MBA levels.

Professor Woolridge's research has centered on empirical issues in corporation finance and financial markets. He has published over 35 articles in the best academic and professional journals in the field, including the *Journal of Finance*, the *Journal of Financial Economics*, and the *Harvard Business Review*. His research has been cited extensively in the business press. His work has been featured in the *New York Times*, *Forbes*, *Fortune*, *The Economist*, *Barron's*, *Wall Street Journal*, *Business Week*, *Investors' Business Daily*, *USA Today*, and other publications. In addition, Dr. Woolridge has appeared as a guest to discuss the implications of his research on CNN's *Money Line*, CNBC's *Morning Call* and *Business Today*, and Bloomberg's *Morning Call*.

Professor Woolridge's co-authored stock valuation book, *The StreetSmart Guide to Valuing a Stock* (McGraw-Hill, 2003), was released in its second edition. He has also co-authored *Spinoffs and Equity Carve-Outs: Achieving Faster Growth and Better Performance* (Financial Executives Research Foundation, 1999), as well as a textbook entitled *Basic Principles of Finance* (Kendall Hunt, 2011).

Professor Woolridge has also consulted with corporations, financial institutions, and government agencies. In addition, he has directed and participated in university- and company-sponsored professional development programs for executives in 25 countries in North and South America, Europe, Asia, and Africa.

Over the past 35 years Dr. Woolridge has prepared testimony and/or provided consultation services in regulatory rate cases in the rate of return area in following states: Alaska, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Hawaii, Indiana, Kansas, Kentucky, Maine, Maryland, Massachusetts, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New Mexico, New York, North Carolina, Ohio, Oklahoma, Pennsylvania, South Carolina, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Washington, D.C. He has also testified before the Federal Energy Regulatory Commission.

Value Line Risk Metrics

Beta

A relative measure of the historical sensitivity of a stock's price to overall fluctuations in the New York Stock Exchange Composite Index. A beta of 1.50 indicates a stock tends to rise (or fall) 50% more than the New York Stock Exchange Composite Index. The "coefficient" is derived from a regression analysis of the relationship between weekly percentage changes in the price of a stock and weekly percentage changes in the NYSE Index over a period of five years. In the case of shorter price histories, a smaller time period is used, but two years is the minimum. Betas are adjusted for their long-term tendency to converge toward 1.00.

Financial Strength

A relative measure of the companies reviewed by *Value Line*. The relative ratings range from A++ (strongest) down to C (weakest).

Safety Rank

A measurement of potential risk associated with individual common stocks. The Safety Rank is computed by averaging two other *Value Line* indexes the Price Stability Index and the Financial strength Rating. Safety Ranks range from 1 (Highest) to 5 (Lowest). Conservative investors should try to limit their purchases to equities ranked 1 (Highest) and 2 (Above Average) for Safety.

Earnings Predictability

A measure of the reliability of an earnings forecast. Earnings Predictability is based upon the stability of year-to-year comparisons, with recent years being weighted more heavily than earlier ones. The most reliable forecasts tend to be those with the highest rating (100); the least reliable, the lowest (5). The earnings stability is derived from the standard deviation of percentage changes in quarterly earnings over an eight-year period. Special adjustments are made for comparisons around zero and from plus to minus.

Stock Price Stability

A measure of the stability of a stock's price. It includes sensitivity to the market (see Beta as well as the stock's inherent volatility). *Value Line's* Stability ratings range from 1 (highest) to 5 (lowest).

November 1, 2008 – May 31, 2009	Normalized 20-year U.S. Treasury yield	4.50	6.00	R_f
October 27, 2008 – October 31, 2008	Spot 20-year U.S. Treasury yield	Spot	6.00	ERP
January 1, 2008 – October 26, 2008	Spot 20-year U.S. Treasury yield	Spot	5.00	Initialized

* We recommend using the spot 20-year U.S. Treasury yield as the proxy for the risk-free rate, if the prevailing yield as of the valuation date is higher than our recommended U.S. normalized risk-free rate of 3.5%. This guidance is effective when developing USD-denominated discount rates as of June 16, 2022 and thereafter.

Normalized in this context means that in months where the risk-free rate is deemed to be abnormally low, a proxy for a longer-term sustainable risk-free rate is used.
