

**BEFORE THE STATE CORPORATION COMMISSION  
OF THE STATE OF KANSAS**

**In the Matter of the Joint Application )  
of Evergy Kansas Central, Inc., ) Docket No.  
Evergy Kansas South, Inc., and ) 23-EKCE-775-RTS  
Evergy Metro, Inc. for Approval to )  
Make Certain Changes in their )  
Charges for Electric Service. )**

**DIRECT TESTIMONY**

**PREPARED BY**

**ROBERT H. GLASS, Ph.D.**

**UTILITIES DIVISION**

**KANSAS CORPORATION COMMISSION**

**August 30, 2023**

1                                   **I.       STATEMENT OF QUALIFICATIONS**

2   **Q.    What is your name?**

3   A.    Robert H. Glass

4   **Q.    By whom and in what capacity are you employed?**

5   A.    I am employed by the Kansas Corporation Commission (KCC or Commission) as  
6        Chief of the Economics and Rates Section within the Utilities Division.

7   **Q.    What is your business address?**

8   A.    1500 S.W. Arrowhead Road, Topeka, Kansas, 66604-4027.

9   **Q.    What is your educational background and professional experience?**

10  A.    I have a B.A. from Baker University with a major in history. I also have an M.A.  
11        and a Ph.D. in economics from the University of Kansas. For 22 years prior to my  
12        employment at the Commission, I was employed at the University of Kansas by the  
13        Institute for Business and Economic Research, which later became the Institute for  
14        Public Policy and Business Research. My primary duty was performing economic  
15        research.

16  **Q.    Have you previously testified before the Commission?**

17  A.    Yes. I provided testimony as a Staff consultant for Docket Nos. 91-KPLE-19 140-  
18        SEC and 97-WSRE-676-MER. As an employee of the Commission, I have testified  
19        in numerous rate case and non-rate case dockets.

## II. INTRODUCTION

### *Purpose*

**Q. What is the purpose of your testimony?**

A. The purpose of my testimony is to evaluate Evergy’s proposed rate changes and to sponsor Staff’s rate design.

### *Organization*

**Q. How is your testimony organized?**

A. First, I will discuss the Rate Modernization Plan. Then, I will discuss the Changes in Rate Design Structure. Next, I will discuss the Time of Use Rates. Then, I will discuss Rate Design. Finally, I will conclude by recommending the Commission approve a modified TOU rate, eliminate certain rates, and accept Staff’s rate design.

## III. ANALYSIS

### **Rate Modernization Plan**

**Q. What is Evergy’s Rate Modernization Plan?**

A. Evergy’s Rate Modernization Plan is Evergy’s “view of the programs and rates needed to move Kansas toward greater customer choice, increased customer satisfaction and better grid management.”<sup>1</sup>

In her testimony, Evergy Witness Kim Winslow responds to the question “Please describe Evergy’s Rate Modernization Plan” by describing a process that began in 2020 with three purposes: (1) Respond to the regulatory obligations in Kansas and Missouri; (2) Balance “forces to increase overall customer satisfaction while recovering Evergy’s revenue requirement;” and (3) Align tariffs between

---

<sup>1</sup> Evergy Direct Testimony Prepared by Kim Winslow, p. 4, (April 25, 2023) (Winslow Direct).

1 EKC and EKM.<sup>2</sup> She also notes that the Rate Modernization Plan is not a one-shot  
2 approach to modernizing rates in the current docket, but a longer process that  
3 Evergy expects to progress over several rate cases.

4 ***Drivers and Objectives of the Rate Modernization Plan***

5 **Q. Does Evergy provide more details of the Rate Modernization Plan?**

6 A. Yes. Evergy lists five drivers of the Rate Modernization Plan that led to eight  
7 objectives that are listed in Figure 1 below. The five drivers are listed on the left-  
8 hand side of the figure and the eight objectives are listed on the right-hand side of  
9 the figure.<sup>3</sup> The drivers are a combination of facts on the ground (Evergy has  
10 multiple service territories in two different jurisdictions), observed attitudes of  
11 customers (the demand for choice), federal public policy goals (beneficial  
12 electrification), and basic goals of rate design (proper price signals and equitable  
13 rates).

3

***Potential Problems with the Drivers of the Plan***

4

5

**Q. Are any of the drivers listed by Evergy that may have limitations or restrictions to implementation?**

6

7

8

9

10

A. One possible example is Evergy's desire to implicitly promote beneficial electrification and grid benefits. Any energy efficiency programs that promote one fuel source over another was rejected by the Commission in Docket No. 09-GIMX-160-GIV.<sup>4</sup> Presumably, the Commission's precedent on this issue would apply to non-energy efficiency programs as well. Thus, any beneficial electrification or grid

<sup>4</sup> Amended Order to Close Docket, Docket No. 09-GIMX-160-GIV, March 23, 2012. "Utility providers shall continue to offer energy-efficiency programs in a manner that does not bias users toward a particular fuel source." Unnumbered page 1. In addition, the order was determined to be precedential.

1 benefit programs will have to be carefully evaluated to determine whether a fuel  
2 source bias is being promoted.

3 ***Inherent Issues with the Objectives of the Plan***

4 **Q. Do the objectives of the Rate Modernization Plan flow from the drivers?**

5 A. For the most part, yes.

6 **Q. Are there any inherent issues with the objectives of the plan?**

7 A. Yes. I think that simplifying rates and making them more transparent, Objective  
8 (4), and improving customer price signals, Objective (8), are inherently  
9 contradictory—improving customer price signals will make rate design more  
10 complex. For example, time-of-use (TOU) rates are more complex and more  
11 difficult to explain to customers than the standard fixed charge/energy charge rate  
12 design. In addition, determining how to leverage CIS and AMI infrastructure  
13 Objective (7)—what is the lever and what is the fulcrum and where is the  
14 “mechanical advantage.”

15 For Objective (2)—bringing rates closer together across jurisdictions, Evergy  
16 provides a justification for reducing the difference in rates across jurisdictions as  
17 the recognition “that customers simply see Evergy as one company and our  
18 customers and shareholders will benefit from increasing consistency with all  
19 customer-facing elements of our operations.”<sup>5</sup>

20 There are two interlocking problems with forcing rates across jurisdictions to  
21 be similar. First, rate design is a zero sum game—if one jurisdiction has higher

---

<sup>5</sup> Winslow Direct, p. 16.

1 rates than another, forcing the rates to be the same will create winners and losers.  
2 Second, the perception of creating winners and losers becomes a subsidy issue if  
3 one service territory has higher costs than the other. And the subsidy problem can  
4 be exacerbated if the regulatory agencies and the general regulatory milieu in one  
5 jurisdiction are more cost conscience than the other.

6 *Should Cost & Rate Minimization be as an Objective of the Plan?*

7 **Q. Does Evergy explicitly recognize cost and rate minimization as an objective?**

8 A. No. Cost and rate minimization are not among the five drivers or eight objectives.

9 **Q. Are you aware of whether Evergy implicitly recognizes cost and rate**  
10 **minimization as an objective?**

11 A. Yes. Staff issued Staff Data Request No. 160 to inquire about this issue. Evergy's  
12 response was:

13 Evergy developed the objectives holistically and the objectives are  
14 guiding principles that Evergy would consider as it furthers its rate  
15 structures, programs, and offerings for its customers. Evergy  
16 recognizes that the objectives could be perceived to be contradictory,  
17 but this is mitigated when viewed in the broader, strategic nature of  
18 the objectives. No rate design "criteria" exists to override one  
19 objective over the other. However, Evergy's North Star is  
20 developing rates that are just and reasonable to ensure efficient and  
21 sufficient service.

22  
23 **Q. Is Evergy's response adequate?**

24 A. Yes. Two important aspects of Evergy's response are reassuring to Staff. First,  
25 Evergy's recognition of the potential for internal conflicts among the objectives.  
26 Second, that Evergy's overall guiding principle with rate design is just and  
27 reasonable rates and that Evergy's overall guiding principle with cost control is  
28 efficient and sufficient service.

1 **Q. Why is Evergy’s recognition of potential conflicts among the objectives**  
2 **reassuring?**

3 A. Any time that a list of objectives is established, if the objectives are not duplicative,  
4 then there will almost certainly be conflict among the objectives. As an example,  
5 consider the use of cooperative game theory to allocate cost among individuals.  
6 Two of the more popular cooperative game allocations are the Shapley Value and  
7 the Nucleolus. The Shapley Value allocates cost based on the average marginal  
8 cost for each player in all possible coalitions while the Nucleolus minimizes the  
9 dissatisfaction of all possible coalitions. Both equilibrium concepts are similar, and  
10 both would fit within a utilitarian perspective of fairness. But if there are more than  
11 three agents in the game, the Shapley Value and the Nucleolus do not necessarily  
12 give the same equilibrium point.<sup>6</sup> Thus, Evergy’s recognition of potential conflicts  
13 in applying the eight objectives of the Rate Modernization Plan is reassuring.  
14 Recognition of the conflicts does not eliminate them, but it does mean that the  
15 conflicts will not be a surprise when they appear.

16 **Q. Why is Evergy’s guiding principle of just and reasonable rates and efficient**  
17 **and sufficient service reassuring?**

18 A. For two major reasons. First, just and reasonable rates and efficient and sufficient  
19 service are standard legal criteria for regulated utilities; and second, for an  
20 economist, the criteria can be operationalized as public policy criteria. Because I  
21 am not a lawyer, I will not address the legal criteria in my testimony. However, the

---

<sup>6</sup> H. P. Young, N. Okada, and T. Hashimoto, “Cost Allocation in Water Resources Development,” *Water Resources Research*, Vol. 8, No. 3 (June 1982), pp. 463 – 475. Table 7 on page 472 shows the difference between the Shapley Value and the Nucleolus solutions.

1 operationalization of just and reasonable rates and efficient and sufficient service  
2 is of paramount importance to me.

3 Just and reasonable rates implies both efficient rates (reasonable rates) and  
4 equitable rates (just rates). Just and reasonable rates set constraints on the utility's  
5 treatment of its customers. And efficient and sufficient service implies least cost  
6 service (efficient service) and sufficient service to meet customer demand (since no  
7 one is excluded service, service is equitable). Thus, the demand and supply sides  
8 of the regulated electricity market were covered by just and reasonable rates and  
9 efficient and sufficient service.

10 **Q. How then to operationalize the legal criteria as for policy evaluation?**

11 A. The basic public policy criteria for an intervention in a market is whether the  
12 intervention is in the public interest, and an intervention is in the public interest if  
13 it improves social welfare. There are two basic means for improving social welfare:  
14 (1) increasing economic efficiency and/or (2) improving equity. Evaluating policy  
15 leads back to whether the policies increase economic efficiency and/or improve  
16 equity.

17 The evaluation of a policy to determine its effect on economic efficiency  
18 involves using benefit-cost analysis. And the best short description of equity  
19 evaluation involves determining the effect of a policy on “redistribution of income,  
20 equality of opportunity, and protection of rights to life and property.”<sup>7</sup> Ideally,  
21 policy makers would like to achieve the goals of economic efficiency and equity

---

<sup>7</sup> Arye Hillman, *Public Finance and Public Policy*, second edition, 2009, p. 3.

1 simultaneously, but often there is a conflict between economic efficiency and  
2 equity. Thus, evaluating whether policies and programs are in the public interest  
3 requires a two-step process. First, the effects of the policies and programs on  
4 economic efficiency and equity must be determined. Second, these effects on  
5 economic efficiency and equity must be weighed to decide if the policies and  
6 programs advance social welfare.

7 **Q. What about the problem of bringing rates closer?**

8 A. For the most part, bringing rates together can be accomplished, but it will be a long  
9 and difficult process. As an example, aligning the old Kansas Power and Light  
10 (KPL) and Kansas Gas and Electric (KG&E) rates, after the merger that eventually  
11 created Westar, took 20 years. And there are still some rates that are available only  
12 in one of the two former service territories, for example school rates.

13 I would expect bringing EKC and EKM rates together will be even harder than  
14 bringing KPL and KG&E rates together for a couple of reasons. First, rate  
15 consolidation takes into consideration legacy rate designs and the level of rates  
16 currently in effect as well as the types of customers and nature of each service area.  
17 Second, the service territories have different energy use behavior and different  
18 industrial structures, and that leads to different cost structures for the service  
19 territories. In addition, Evergy would like Evergy Kansas Metro and Missouri  
20 Metro to be similar, but they are in different regulatory jurisdictions with seemingly  
21 different regulatory approaches.

1 **Q. What is Staff’s most important criteria for the Rate Modernization Plan?**

2 A. Like all plans, the most important aspect of any plan is its implementation. Without  
3 flexible and adaptive implementation, the Rate Modernization Plan could result in  
4 a more complex and opaque set of customer rates rather than “simplifying rates and  
5 increase pricing transparency.”

6 **Changes in Rate Design Structure**

7 **Q. Has Evergy begun the implementation of its Rate Modernization Plan?**

8 A. Yes. Evergy Witness Marisol Miller provides a description of Evergy’s request to  
9 change the structure of EKM’s and EKC’s rate design. Evergy wants to have the  
10 same seasonal alignment in EKM’s and EKC’s rates, “establish Bright Lines and a  
11 new rate class” for its EKM commercial and industrial customers, transition away  
12 from EKM’s hours of use commercial and industrial rate design, align rate designs  
13 between the different jurisdictional utilities that comprise Evergy, and generally  
14 cleanup and simplify existing rates.<sup>8</sup>

15 ***Seasonal Alignment***

16 **Q. What is seasonal alignment of rates?**

17 A. In Kansas, there are basically three different electric demand seasons: summer,  
18 winter, and shoulder, which includes spring and fall. Because of air conditioning,  
19 electric utilities in our area tend to peak in the summer.<sup>9</sup> The next highest usage  
20 period in winter is because some customers have electric space heating. Finally,  
21 the shoulder months are a period of relatively low usage.

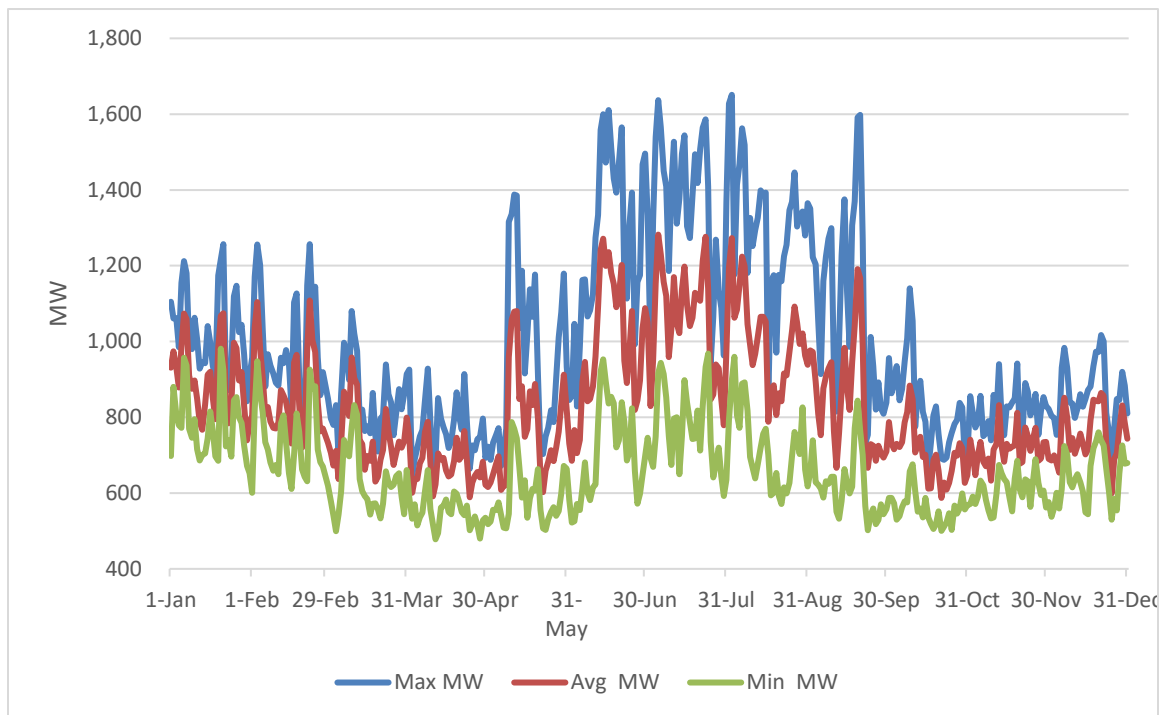

---

<sup>8</sup> Evergy Direct Testimony Prepared by Marisol Miller, p. 4, (April 25, 2023), (Marisol Direct).

<sup>9</sup> Liberty Utilities, the old Empire, is an exception because it has a winter peak that is driven by electric space heating.

1 EKM and EKC have different definitions of winter and summer. For EKM,  
2 summer is May 16 through September 15 while for EKC, summer is June 1 through  
3 September 30. Evergy decided that EKM should adopt EKC's definition of  
4 summer. Evergy Witness Miller provides a compelling demonstration of the  
5 appropriateness of this decision with a graph of daily peak, average, and minimum  
6 loads for EKM on page 7 of her testimony that is reproduced below as Figure 2.

7 **Figure 2**

8

9 **Q. Will the seasonal alignment affect EKM's customers' bills?**

10 A. Yes, but only slightly. Evergy estimates that it will lower its revenue recovery by  
11 about \$280,000 or a reduction in revenue of about 0.05%.

12 **Q. What is Staff's recommendation?**

13 A. Staff recommends that the Commission approve the change in the definition of  
14 summer in the EKM rates to the definition of summer in the EKC rates.

1 *Establishing Bright Lines for Commercial and Industrial Customers*

2 **Q. What are Bright Lines?**

3 A. “Bright Lines” is a term used to emphasize the creation of thresholds among  
4 customer classes in order to prevent customers from moving back and forth  
5 between rate classes solely at the customer’s discretion.

6 **Q. Why is it a problem if customers can change rate classes at their own  
7 discretion?**

8 A. Frequent switching among rate classes increases revenue uncertainty for regulated  
9 utilities. The rates are set to allow the utility the opportunity to recover its approved  
10 revenue requirement. For example, a small change in the former Large Power  
11 Class’s rate design ended up eliminating the class and costing KCP&L about a  
12 million dollars. In order to establish effective revenue recovery, customers need to  
13 remain in the rate classes where the rate design was established based on their usage  
14 behavior. This does not mean that if a customer grows (or shrinks) significantly in  
15 usage, they should not be allowed to change rate classes. But barring a significant  
16 change in usage, customer’s need to remain in the rate class where the rate design  
17 was establish based on their behavior in order to reduce revenue uncertainty for the  
18 utility.

19 **Q. Does the Commission have any recent experience with the establishment of  
20 Bright Lines?**

21 A. Yes. Westar was experiencing revenue instability because of its Commercial and  
22 Industrial rates about 10 years ago. In the 15-WSEE-115-RTS docket, the problem  
23 was ameliorated by the use of a set of bright lines among customer classes.<sup>10</sup>

---

<sup>10</sup> Direct Testimony of John Wolfram, Docket No. 15-WSEE-115-RTS, (Wolfram 115 Direct), pp. 12, 32.

1 **Q. What is Evergy proposing here?**

2 A. Evergy “concluded that Bright Lines of 30-200-1,500 maximum kW for Small,  
3 Medium, and Large General Service classes, respectively, along with the creation  
4 of a Large Power Class above 1,500 kW, would be most appropriate for the EKM  
5 jurisdiction.”<sup>11</sup>

6 ***Implementation of Bright Lines and Eliminating Hours of Use Energy Charges***

7 **Q. Will there need to be a change in EKM’s rate design to implement the change?**

8 A. Yes. EKM Commercial and Industrial rate design is dominated by a hybrid rate  
9 design that uses customer charges, facilities charges, demand charges, and hours of  
10 use energy rates. The hours of use energy rates include an implicit demand charge  
11 in the first block. In order to transparently create the Bright Lines, the demand  
12 charges need to be explicit. Thus, the hours of use energy charges need to be  
13 eliminated.

14 **Q. Is the hours of use energy charge like a time of use (TOU) rate?**

15 A. No. A TOU rate establishes a different rate for different parts of the day. For  
16 example, a peak rate for the time during the day that the utility usually faces its  
17 peak demand, and an off-peak rate otherwise. Additional time periods can be added  
18 to encourage usage during periods of normally low usage, such as a super off-peak  
19 rate from midnight to six in the morning in the summer.

20 The hours of use rate is dependent upon the maximal demand on the part of the  
21 customer and encourages a high load factor. For example, assume that a customer  
22 has a demand of 10 kW and the hours of use rate is set up for blocks of up to 100

---

<sup>11</sup> Miller Direct, p. 10.

1 hours, 101-200, and 201 and above with a sharply lower rate in the second block  
2 and an even lower rate in the last block. At a demand of 10 kW, it would take 1,000  
3 kWh to fill the first hours block: 100 hours. After customers consume 1,000 kWh,  
4 they are transitioned into the second block of 101-200 hours. After the customers  
5 consume another 1,000 kWh or a total 2,000 kWh, they are transitioned into the  
6 third hours block. Since each block has a lower energy charge, the rate design  
7 creates an incentive to use more energy but maintain the same level of demand, or  
8 in other words, customers are incentivized to increase their load factor.

9 **Q. Is Evergy willing to eliminate its hours of use rate in the EKM jurisdiction?**

10 A. Yes. The company hired the Brattle Energy Group to study the transition away  
11 from the hours of use energy charge “to a more standard and more transparent  
12 energy charge calculation.”<sup>12</sup>

13 **Q. What is Evergy proposing?**

14 A. For Small General Service customers, Evergy is proposing seasonal (summer and  
15 winter) time of use energy charges with a customer charge but no demand charge.  
16 For the Medium and Large General Service customers, Evergy is proposing flat  
17 summer and winter demand charges with summer and winter time of use energy  
18 charges.

19 **Q. Will all Commercial and Industrial customers be transitioned to the new**  
20 **rates?**

21 A. No. Evergy has not settled on a method for integrating TOU rates with net  
22 metering. Those Commercial and Industrial customers that have net metering will

---

<sup>12</sup> Miller Direct, p. 22.

1 remain on the hours of use rate until the integration of TOU rates and net metering  
2 is resolved.

3 ***Elimination of Some Rates in the EKM Service Territory***

4 **Q. Does Evergy propose elimination of rates other than the hours of use rates?**

5 A. Yes. Evergy has a number of frozen rates in EKM and EKC and proposes  
6 elimination of all frozen rates. Starting in the EKM service territory, Evergy wants  
7 to eliminate the 2 Meter Heat rate (frozen January 1, 2007) and the 2 Meter Electric  
8 Heating and Electric Water Heating (frozen March 1, 1999).

9 **Q. Why does Evergy want to eliminate these rates?**

10 A. Evergy wants to move away from end-use rates, and heating discounts are a classic  
11 example of an end-use rate.

12 **Q. What is the problem with end-use rates?**

13 A. End-use rates were designed as proxies for TOU rates before more sophisticated  
14 meters made TOU rates practical for a wide spectrum of customers. For example,  
15 heating discounts. For residential customers, most heating takes place in the winter,  
16 and historically that has been a non-peak period for Evergy. Thus, discounts for  
17 heating are a proxy for energy use in a non-peak season with a large amount of  
18 energy used at night for heating, which is a non-peak time period. But with better  
19 meters, proxies are no longer needed for TOU rates.

20 **Q. How many customers will be affected by this change?**

21 A. Evergy estimates there are still 11,940 customer on these rates.

1 **Q. If customers invested in electric space heating assuming they would get a**  
2 **discount, is it fair to take that discount away after they have made the**  
3 **investment?**

4 A. There are at least two factors that mitigate the effect of the change in rates on the  
5 investment. First, it has been more than 15 years since customers have had the  
6 incentive to invest in electric space heating with a second meter. The freezing of  
7 the rate was a signal that the rate would probably not continue forever. Thus, the  
8 investment seems to have been remunerated. Second, customers with electric space  
9 heating have the option of choosing a TOU rate that provides a rate discount during  
10 winter nights unless they are net metering customers.

11 **Q. What other rate changes is Evergy requesting?**

12 A. Evergy wants to move customers on the Residential Other rate to the Residential  
13 Standard rate and eliminate the Residential Other rate.

14 **Q. What is the Residential Other rate?**

15 A. The Residential Other rate was designed for residential customers that have “well  
16 pumps, barns, machine sheds, detached garages, etc., and whose corresponding  
17 usage would not currently qualify under any other residential rate.”<sup>13</sup>

18 **Q. Why does Evergy want to eliminate the Residential Other rate?**

19 A. There are only 472 customers on the rate and Evergy considers the above listed  
20 reasons for being on the rate as extensions of residential electric usage.

21 **Q. Are there any other rates in EKM that Evergy wants to eliminate?**

22 A. Yes. Evergy has a time of day rate that has been frozen since 2015 and only has 40  
23 customers on it. Since Evergy has a TOU rate, the time of day rate seems

---

<sup>13</sup> Miller Direct, p. 17.

1 redundant. However, the time of day rate is more moderate than the current TOU  
2 rate.

3 ***Elimination of Some Rates in the EKC Service Territory***

4 **Q. What rates does Evergy want to eliminate from the EKC service territory?**

5 A. Evergy has a number EKC rates they want to eliminate. Following is a list taken  
6 from Evergy Witness Miller's testimony:

7 (1) Residential

8 (a) Multi-Unit Rate (frozen) from the Residential Standard Service Rate

9 (b) Conservation Use Service Factor from Residential Standard Service Rate

10 (c) Restricted Conservation Use Service Rate (frozen)

11 (d) Restricted Peak Management Electric Service Rate (frozen)

12 (e) Residential Electric Vehicle (EV) Rate

13 (2) Commercial & Industrial

14 (a) Off Peak Service Rate (Create new Off-Peak Rider)

15 (b) Dedicated Off Peak Service Rate

16 (c) Generation Substitution Rate

17 (d) Small General Service Recreational Lighting Rate

18 **Q. Do you agree eliminating rates codes is a good idea?**

19 A. In general, elimination of rate codes in EKC is a good idea. I counted 17 different  
20 rate codes in the Small General Service class with at least 6 rate codes having  
21 identical rate designs. I will just note a few aspects about some of these rates.

22 ***Multi-Use Rate:*** "The Residential Service tariff includes a provision frozen since  
23 1978 that allows single metered multiple occupancy residential buildings to take

1 service under the Residential tariff. This represents a stark difference when  
2 compared to Evergy's other jurisdictions that bill these kinds of customers on  
3 commercial rates."<sup>14</sup> Although these are multiple occupancy buildings, the average  
4 usage per bill is about 1,300 kWh, which is not far from the average for Residential  
5 homeowners. In other words, it does not distort the Residential Class billing  
6 determinants to include these residences in the Residential class. But they do seem  
7 more like a small business than a residence.

8 ***Conservation Use Service:*** This rate has been frozen since 2006. Its purpose is to  
9 "disincentivize energy usage during the summer billing months by offering a lower  
10 energy rate to customers who kept their average daily consumption under 30 kwh  
11 (equal to 900 kwh for a standard 30-day monthly bill) during the summer billing  
12 months."<sup>15</sup> The average usage by the customer on the conservation rate is a little  
13 over 900 kWh a month, but only 6.7% of the usage is in the summer. And the  
14 customer charge is the same as for regular residential customers, there is no demand  
15 charge, and the energy rate is low—4.3681¢ per kWh compared to 7.1987 per kWh  
16 for regular residential customers.

17 ***Restricted Peak Management Electric Service:*** This rate has also been frozen since  
18 2006. Its purpose was to provide a discount to space heating customers as was  
19 explained to me by Westar years ago. It is a rate design with a higher customer  
20 charge—\$16.50 rather than \$14.50 for regular residential, a relatively low demand  
21 charge—\$2.13 in the winter and \$6.91 in the summer per kW, and a low energy

---

<sup>14</sup> Miller Direct, p. 45.

<sup>15</sup> Miller Direct, p. 45.

1 charge—4.3681¢ kWh in both winter and summer. What distinguishes this rate,  
2 and makes it applicable as a space heating discount, is that the demand used for the  
3 demand charge is non-coincidental peak demand. Space heating, has inexpensive  
4 demand and energy rates in the winter, and if demand is controlled in the summer,  
5 lower bills because of the inexpensive summer energy rate. However, Evergy  
6 found in its review process that 63% of the customers on this rate would experience  
7 a reduced bill if they moved to the regular residential rate.

8 ***Off-Peak and Dedicated Off-Peak Service:*** The Off-Peak Service has only four  
9 customers and the Dedicated Off-Peak Service had only two customers during the  
10 test year and as of June 2023 it has no customers. These are two of the 17 rate  
11 codes that I counted in the Small General Service class.

12 ***Small General Service Recreational Lighting:*** In order for EKC to be consistent  
13 with EKM, Evergy wants to move approximately 450 customers on this rate either  
14 to a new Off-Peak Lighting rate in the Lighting class or shift the customers to the  
15 Small General Service Unmetered rate. Since lighting is unmetered, the shift to the  
16 unmetered class has a logic to it.

17 ***Recommendation***

18 **Q. What is Staff's recommendation concerning the elimination or freezing of**  
19 **rates?**

20 **A.** Staff agrees that the rates suggested for elimination have good substitute rates that  
21 the customers can move to without a large rate shock. And part of the reason for  
22 the expected increase in rates is due to the unusually low rates these customers

1           currently have. Additionally, eliminating these rates would reduce some of the  
2           confusion in the rate design.

3           **Time of Use Rates**

4           **Q.     Does Evergy have time of use rates?**

5           A.     Yes. Evergy has time of use rates in both EKM and EKC. In EKM, KCP&L  
6           proposed a TOU pilot in the 18-KCPE-480-RTS with a cap of 1,000 customers and  
7           a marketing and education budget of \$2.2 million. The enrollment cap was  
8           surpassed in January 2021 and as of March 17, 2023 there were 2,892 customers  
9           on the rate.<sup>16</sup>

10           In EKC, Westar introduced a pilot TOU rate as part of the Lawrence  
11           Project—the introduction of AMI meters in the Westar service territory. The TOU  
12           pilot participation languished between 30 and 50 customers for several years. At  
13           the start of the test year, the number of customers was 64; but that number rose to  
14           101 by the end of the test year. From the end of the test year to the end of June  
15           2023, another 70 were added to the TOU pilot rate.

16           ***Performance of Evergy’s TOU Pilot in EKM Service Territory***

17           **Q.     How does Evergy evaluate the performance of the TOU pilot in the EKM**  
18           **service territory?**

19           A.     The TOU pilot is working. “[T]he initial TOU rates have met or exceeded  
20           enrollment goals, reduced system coincident peak demand; and aligned pricing  
21           structure with cost causation.”<sup>17</sup>

---

<sup>16</sup> Winslow Direct, p. 6.

<sup>17</sup> Evergy Direct Testimony Prepared by Bradley Lutz, Docket 23-EKCE-775-RTS (Lutz Direct), p. 16.

1 **Q. Does Staff agree with Evergy's evaluation?**

2 A. Yes. The program has performed better than Staff expected, in large part because  
3 of the performance of the Westar TOU pilot. In addition to almost tripling the  
4 initial customer cap, Evergy has only spent about \$1.5 million of the \$2.2 million  
5 budgeted for the program. In a study for Evergy, Guidehouse, Inc. (Guidehouse)  
6 found that the TOU rate in Evergy Missouri Metro reduced energy usage during  
7 the peak hours and reduced average summer coincidental peak demand by 0.31 kW  
8 and 0.12 kW in Evergy Missouri West.<sup>18</sup> The Guidehouse report, attached to  
9 Company Witness Winslow's testimony, describes the impact on customer bills,  
10 energy usage, comfort, and customer satisfaction.

11 **Q. Was there anything missing from the report?**

12 A. I was not able to find a benefit-cost analysis of the pilot in the report.

13 **Q. Is the lack of the benefit-cost analysis a major problem?**

14 A. No, for three of reasons. First, the costs can be limited to a finite period while the  
15 benefits should accrue over a much longer period than the pilot. For this reason, a  
16 benefit-cost analysis for this type of pilot is difficult. Second, there seems to be  
17 spillovers from the EKM pilot on the participation rate for the EKC TOU rate.  
18 Third, program participation has exceed Staff's expectations with the marketing  
19 and educational costs less than 70% of the initial budget.

---

<sup>18</sup> Winslow Direct, p. 8.

1 *Evergy's Requested Changes to the TOU Rate Designs in EKM and EKC*

2 **Q. Does Evergy want to change anything about the TOU Pilot other than making**  
3 **the rate permanent?**

4 A. Yes. Evergy wants to align the TOU rates in EKM and EKC in four different  
5 dimensions—seasonal periods, peak times of the day, TOU period structure, and  
6 the TOU energy rates. The alignment of seasonal periods was discussed earlier and  
7 carries through with the TOU rate—use the EKC seasonal definitions of summer as  
8 June through September and winter as October through May.

9 Evergy wants to make the peak times of the day to be 4:00 to 8:00 pm for both  
10 EKM and EKC. Currently, summer peak in EKC is 1:00 to 8:00 pm and winter  
11 peak is 10:00 am to 8:00 pm while EKM is 4:00 to 8:00 pm. The present TOU rate  
12 in EKC has three periods in the summer and two in the winter while the EKM's  
13 TOU rate has three periods during both seasons. Finally, the EKC TOU energy  
14 charges have a much smaller differential between the peak periods and the off-peak  
15 periods. For the EKC TOU rate, the difference in energy charges between the peak  
16 rate and the lowest off-peak rate is slightly more than 2:1 while in EKM the  
17 difference is 6:1. Evergy wants to move to a ratio of 7:1 in both service territories.

18 *Standardizing 4:00 to 8:00 PM as the Peak Period*

19 **Q. Why does Evergy want to change the peak period to 4:00 to 8:00 pm?**

20 A. Evergy hired Brattle to analyze the TOU rates in EKM and EKC and make  
21 recommendations for change. Brattle found that the optimal TOU rate for Evergy  
22 Kansas was 3:00 to 7:00 pm. However, residential customers tend to peak later  
23 than the system peak, and for both EKM and EKC residential customers 4:00 to

1 8:00 pm is the optimal peak.<sup>19</sup> In addition, Brattle mentions three other reasons  
2 why the 4:00 to 8:00 pm peak period may be preferable: increases in solar energy  
3 will probably push the peak later as it has in California, 4:00 to 8:00 provides  
4 consistency between Missouri and Kansas jurisdictions, and since Evergy has used  
5 the slogan “wait till eight” in its marketing campaign, any change could cause  
6 confusion.<sup>20</sup>

7 **Q. Does Staff agree with the switching of the peaking period to a standard 4:00**  
8 **to 8:00 pm?**

9 A. Yes. For the summer, the 4:00 to 8:00 pm peaking period makes sense. A standard  
10 peaking period avoids confusion. And the evidence from California and other  
11 places of solar deployment shifting the peak period later is convincing. However,  
12 there could be a problem with using 4:00 to 8:00 pm as the winter peaking period  
13 in the future. EKC has had winter months, such as December or January, where  
14 the monthly peak occurred in the morning. If solar deployment continues to grow,  
15 electric vehicles become more ubiquitous, and switching to heating electrification  
16 takes hold; Evergy could become a winter peaking utility with its winter peaks in  
17 the early morning before the sun rises. In that case, cost causation suggests  
18 changing the peaking hours in the winter. This has not happened yet and it may  
19 never happen, but this one of those contingencies that should be considered for the  
20 future.

---

<sup>19</sup> Lutz Direct Exhibit BDL-2, Brattle, *Residential Rate Benchmarking and Market Research*, p. 10. The graphs are in Lutz’s direct testimony (p. 20) but because the graphs in the Brattle report are in landscape, it is easier to see the peaks are between 4:00 and 8:00 pm for residential customers.

<sup>20</sup> *Id.*, p. 3.

1 *Standardizing Three-Period TOU Rate in both Summer and Winter*

2 **Q. Why does Evergy want a standardized three-period TOU rate in both EKM**  
3 **and EKC?**

4 A. Kansas Metro, Missouri Metro, and Missouri West all have three-period TOU rates  
5 in the summer and winter. In addition, the three-period rate is the most used form  
6 for a TOU rate design.

7 **Q. Does Staff agree with the three-period summer and winter TOU rate?**

8 A. The three-period TOU rate certainly makes sense in the summer. For the winter  
9 period at the present time, there is not much to recommend either two or three-  
10 period rates. But standardization has its value, and in this case it seems enough of  
11 a reason to have a three-period TOU in the both the summer and winter.

12 *Differential Between Peak Rate and the Lowest Off-Peak Rate*

13 **Q. What rate design does Evergy offer for the TOU rates?**

14 A. Table 1 below is a copy of a table in Evergy Witness Bradley D. Lutz's testimony  
15 that shows the proposed TOU rates in EKM and EKC. Notice the dramatic  
16 difference between the super off-peak rate and the peak rate. For EKM, the  
17 difference is slightly more than 25 cents, and for EKC, the difference is slightly  
18 more than 22.5 cents.

1

**Table 1**

	<b>EKC – 3 Period TOU</b>	<b>EKM – 3 Period TOU</b>
<b>Customer Charge</b>	\$16.71	\$16.71
<b>Energy Charge (per kWh)</b>	Winter Peak: \$0.23359 Off-Peak: \$0.06674 Super Off-Peak: \$0.03337  Summer Peak: \$0.26268 Off-Peak: \$0.07505 Super Off-Peak: \$0.03753	Winter Peak: \$0.21978 Off-Peak: \$0.06279 Super Off-Peak: \$0.03140  Summer Peak: \$0.29270 Off-Peak: \$0.008363 Super Off-Peak: \$0.004181
<b>Period Design</b>	All Seasons Peak = 4 to 8 pm on non-holiday weekdays Super off-peak = midnight to 6 am on all days. Off-peak = all other hours	

2

3 **Q. What is the differential that Evergy is proposing?**

4 A. The difference between the super off-peak and the peak period is 7:1. The  
 5 difference between the off-peak and the super off-peak is 2:1. This is referred to as  
 6 a 1:2:7 TOU rate design.

7 **Q. Why is Evergy increasing the differential in EKM from 6:1 to 7:1?**

8 A. Evergy believes the 7:1 offers TOU rate customers a greater opportunity to save  
 9 money.

10 **Q. Does Staff have any disagreement with Evergy’s proposed 7:1 differential?**

11 A. Staff wonders why it is the only TOU rate differential Evergy is offering.

12 **Q. Why does Staff think Evergy should offer additional TOU rates with different  
 13 differentials?**

14 A. Lutz states several times that Evergy is committed to expanding customer  
 15 participation in TOU rates. But TOU rates are a hard sell. For example, Brattle’s

1 first two sentences in its “Summary of findings and insights” are: “Despite  
2 widespread availability across most states, enrollment in TOU rates is still very low  
3 nationwide. Only a few utilities have substantial (i.e., >10%) participation in TOU  
4 rates.”<sup>21</sup> Without the extensive marketing and education the Evergy undertook in  
5 EKM, the TOU rate in EKC languished between 30 and 50 customers for years.  
6 Evergy spent \$1.5 million in marketing for about 3,000 customers—that is \$500 per  
7 customer. EKM at present has 54,267 customer on the Average Pay rate. That is  
8 a rate that is designed to aid customer budgeting with the added advantage that  
9 customers don’t have to worry about price signals.<sup>22</sup>

10 The above paragraph is not intended to be an argument against TOU rates, but  
11 an argument that a more gradual approach might be more effective. EKM has  
12 probably already gotten most of the easy early adapters for its TOU rate. Instead  
13 of making the differential in the TOU higher by moving from a 6:1 to a 7:1 in EKM  
14 and from a little more than 2:1 to 7:1 in EKC, Staff suggests a more moderate  
15 approach, which is to Why not have a TOU rate with a difference somewhere  
16 between 2:1 and 3:1 for those customer that might want to try but are scared off by  
17 a summer peak between 25 and 30 cents per kWh.

---

<sup>21</sup> *Id.*, p. 1.

<sup>22</sup> Staff Data Request 159. EKC has 147,561 customers on the Average Pay rate. Both EKM and EKC have slightly less than a quarter of their customers on Average Pay.

1 ***Recommendation***

2 **Q. Please summarize your recommendation regarding TOU rates.**

3 A. Staff is suggesting two TOU rates, one moderate and one more extreme. The more  
4 moderate rate would have a differential somewhere between 2:1 and 3:1; while the  
5 more extreme could be 6:1 as it is now or 7:1 as Evergy is proposing.

6 **Q. Is that Staff's recommendation?**

7 A. Yes. Staff recommends two TOU rates, one moderate and one more extreme.  
8 There is no doubt that TOU rates help send appropriate price signals to customers.  
9 But Staff does not want to limit TOU rates to only those customers who will try a  
10 high-differential rate structure.

11 **Rate Design**

12 **Q. What is rate design?**

13 A. Rate design is both a process and the end result of the process. That is, the rate  
14 design process results in the rate design—the specific rates for customer groups.

15 **Q. What is the rate design process?**

16 A. The rate design process involves two major steps. The first step is the allocation of  
17 the revenue requirement to the customer class such as the Residential class. The  
18 second step is to establish rates in each of the customer classes that allow the utility  
19 to recover its approved revenue requirement.

20 **Q. What are the essential requirements for developing a rate design?**

21 A. Billing determinants and the CCOS study are the two essential requirements for  
22 rate design development.

1 ***Billing Determinants***

2 **Q. Please explain what billing determinants are and why they are important in a**  
3 **rate case.**

4 A. Billing determinants consist of all the data needed to generate existing and proposed  
5 revenues. They include the number of customers, demand, and annual volumes  
6 used by rate block, along with the tariff rates necessary to generate existing and  
7 proposed revenues. Billing determinants are essential for constructing a proof of  
8 revenue, which (1) demonstrates that the company's revenue requirement can be  
9 recovered, and (2) provides a comparison of existing rates and proposed rates.

10 **Q. Are Staff's and Evergy's Billing Determinants the same?**

11 A. No. Staff's and Evergy's billing determinants differ because of differences in the  
12 results of weather normalization and customer annualization. In addition Staff  
13 updated the customer count through June 2023 to account for customer growth after  
14 the test year. For Staff's explanation of our weather normalization and customer  
15 annualization processes, see the testimony of Staff Witness Lana Ellis. For Staff's  
16 explanation of the updating of the customer count, see the testimony of Staff  
17 Witness Justin Grady.

18 ***Class Cost of Service***

19 **Q. What does a Class Cost of Service study do?**

20 A. A Class Cost of Service (CCOS) study allocates to a utility's customers the costs  
21 incurred in providing electricity to those same customers. Since electric rates are  
22 set for classes of customers, the CCOS study allocates the cost of service to  
23 particular rate classes. The CCOS study broadly informs the rate analyst how much  
24 it costs to serve each class. Thus, using a CCOS study as a starting point and guide

1 for class allocation of the revenue requirement ensures the rate analyst is beginning  
2 the rate design process by employing the principle of cost causation.

3 The link between the CCOS and cost causation is the strength of using a CCOS  
4 study for revenue allocation. However, CCOS studies do have limitations. First,  
5 CCOS studies are an art; they are not a science—a substantial number of subjective  
6 judgments must go into the production of any CCOS study. Second, because all  
7 CCOS studies are based on allocation mechanisms that are approximations of  
8 structural relationships, the CCOS studies must, themselves, be viewed as  
9 approximations. Third, the approximations of the structural relationships are not  
10 based on statistical theory (for the most part) so determining a confidence interval  
11 using statistical techniques is not possible. Further, because of the size and  
12 complexity, only crude sensitivity analysis is possible. Therefore, it is difficult to  
13 get a handle on the accuracy of the approximation using sensitivity analysis. Thus,  
14 we are left knowing that the cost allocation from a CCOS study is an approximation,  
15 but we cannot know precisely the numerical bounds of the approximation. Fourth,  
16 a CCOS study is a static snapshot of a dynamic process. Over time, the structural  
17 cost relationships have changed and are expected to change in the future. Thus, a  
18 rate analyst should be cautious when using a CCOS study to help determine class  
19 revenue allocations.

20 **Q. Did Staff provide CCOSs for EKM and EKC in this Docket?**

21 A. Yes. Staff Witness Kristina Luke-Fry sponsors Staff CCOS studies for EKM and  
22 EKC in her Direct Testimony.

1 *Allocation of the Revenue Requirement to Base Rates*

2 **Q. What are Staff's recommended changes the EKM and EKC's revenue**  
3 **requirement?**

4 A. Staff is recommending a \$42,274,032 decline in EKM's revenue requirement and  
5 a \$109,524,552 increase in EKC's revenue requirement.

6 **Q. How were the changes in revenue requirement allocated?**

7 A. Table 2 has the allocation of revenue requirement for EKM and Table 3 has the  
8 allocation of revenue requirement for EKC.

1

**Table 2**

<b>Allocation of the Decline in Revenue Requirement Among Evergy Metro's Customer Classes</b>							
	<b>Revenue with Current Rates \$</b>	<b>Relative Rate of Return</b>	<b>Equal Rate Decrease in Class Revenue</b>	<b>Actual Decrease in Class Revenue</b>	<b>Class Share of Increase in Revenue</b>	<b>Total Revenue (1) + (3)</b>	<b>Share of Total Revenue</b>

2  
3  
4  
5  
6

1 Both tables have the same structure: Column (1) has the current revenue for  
2 each class generated by the current rates; Column (2) has the relative rate of return  
3 for each class from the CCOS for the appropriate service territory; Column (3) has  
4 the revenue requirement allocation if each class got the same proportion of the  
5 change in revenue requirement as that class's proportion of the total revenue  
6 generated with current rates; Column (4) has Staff's proposed change in revenue  
7 requirement allocation; Column (5) has the class percentage share of the change in  
8 revenue requirement; Column (6) is the sum of the revenue with current rates,  
9 Column (1), and the allocated increase in class revenue, Column (3); and Column  
10 (7) is the class share of total revenue, Column (6).

11 **Q. How did you arrive at the allocation of the change in revenue requirement?**

12 A. The first step was to calculate an equal proportional change in revenue requirement  
13 based on the proportion of current rate each class had of the total revenue. In other  
14 words, I divided the class revenue by the total revenue and multiplied that  
15 proportion times the total change in revenue requirement. The equal proportional  
16 change would represent a neutral change for a customer class. The result of this  
17 calculation is in Column (3) of Tables 2 and 3.

18 The second step was to go to the CCOS and get the class relative rate of returns.  
19 A change based solely on a class's relative rate of return would be the most extreme  
20 change in revenue. I used the equal proportion allocation and the relative rate of  
21 return as the lower and upper bounds to the targeted revenue requirement allocation.  
22 For EKM, the targeted change in revenue requirement represents a 7.16% decline  
23 in revenue. Thus, a decline in revenue requirement of more than 7.16% or a decline

1 of less than 7.16% would represent the influence of the class relative rate of return.  
 2 For EKC, the targeted change in revenue requirement represents an 8.92% increase  
 3 in revenue. Tables 4 and 5 below shows the decrease and the percentage decrease  
 4 in class revenue requirement for EKM. In general, I moved the percentage change  
 5 in revenue requirement in the direction, but not the magnitude, that the class relative  
 6 rate of return indicated.

**Table 4**

2

3 **Q. Were you able to design rates to collect the revenue allocation targets?**

4 A. Due to rounding of rates, it is not possible to design rates that exactly recover the t  
 5 revenue target. Tables 6 and 7 illustrate the target and actual revenue for EKM and  
 6 EKC respectively.

1

**Table 6**

6

1 **Q. Were there any other issues with class allocation?**

2 A. Yes. The allocation of the economic development rider (EDR). House Bill 2585  
 3 in the 2020 session stipulated that the economic discounts need to be distributed  
 4 using a “uniform percentage adjustment to the revenue requirement for all customer  
 5 classes[.]” Thus, the EDR needs to be allocated to all customer classes based on  
 6 the percentage of total revenue each class has. Then the rest of the revenue  
 7 requirement is allocated to the customer classes using the CCOS study as a guide.  
 8 Tables 8 and 9 below show the allocation of the EDR and the resulting allocation  
 9 of the rest of the revenue requirement respectively.

10 **Table 8**

2

3 ***Rates for Customers***

4 **Q. How were rates for the customers in the different customer classes**  
 5 **determined?**

6 **A.** The EKM rates were determined by multiplying the different demand and energy  
 7 charges by the fixed percentage necessary to reduce the class revenue requirement  
 8 the allocated amount. The customer charge was unchanged in all classes.

9 The EKC rates were determined in a similar fashion except that the customer  
 10 charge was raised slightly for the commercial and industrial customers. For  
 11 example, if the customer charge was \$29, then it was raised to \$30. The rest of the

1 increased revenue came from raising the demand and energy charges the same  
2 proportion.

3 **Q. Why did you place nearly all of the revenue requirement changes in the**  
4 **variable charges and not the customer charge?**

5 A. By not changing the EKM customer charge, I am essentially increasing the  
6 customer charge relative to the decline in the demand and energy charges, but only  
7 moderately. A large part of the increase in revenue requirement in EKC was due  
8 to the offsetting of the retail energy cost adjustment (RECA) and the rebasing of  
9 the property tax surcharge (PTS). Both of these are collected based on kWh, thus  
10 collecting the largest part of the revenue requirement increase in EKC from the  
11 variable charges followed naturally from the source of the increase.

12 The rate designs for the rate codes with different rate designs are provided as  
13 exhibits to this testimony. The rate designs for EKM are in Exhibit-RHG-1 and the  
14 rate designs for EKC are in Exhibit-RHG-2.

15 ***Bill Impact of Rate Changes on Residential Customers***

16 **Q. Have you calculated the bill impact of the decline in revenue requirement in**  
17 **EKM and the increase in revenue requirement in EKC?**

18 A. Yes. Table 10 has the impact on residential customers for EKM and Table 11 has  
19 the bill impact on residential customers for EKC.

2

3 **Recommendation**

4 **Q. What is your recommendation regarding rate design?**

5 **A. I recommend the Commission accept Staff’s rate design.**

1

**IV. CONCLUSION**

2

**Q. Please summarize the recommendations discussed in your testimony.**

3

A. I recommend the Commission approve a modified TOU rate, eliminate certain rates, and accept Staff's rate design.

4

5

**Q. Does this conclude your testimony?**

6

A. Yes. Thank you.
